$$I = \int_{\frac{\pi}{4}}^{\pi} \int_0^{2\sin\theta} f(r\cos\theta, r\sin\theta) r \mathrm{d}r \mathrm{d}\theta$$

$$= [\int_0^{\sqrt{2}} \int_{\frac{\pi}{4}}^{\pi - \arcsin\frac{r}{2}} + \int_{\sqrt{2}}^2 \int_{\arcsin\frac{r}{2}}^{\pi - \arcsin\frac{r}{2}}] f(r\cos\theta, r\sin\theta) r \mathrm{d}r \mathrm{d}\theta \tag{1}$$

$$\lim_{n \to +\infty} (1 - \frac{1}{1+2})(1 - \frac{1}{1+2})(1 - \frac{1}{1+2+3}) \ldots (1 - \frac{1}{1+2+\cdots+n}) = ? \tag{2}$$

$$1 - \frac{1}{\frac{n(n+1)}{2}} = 1 - \frac{2}{n(n+1)}$$
$$= \frac{n^2 + n - 2}{n(n+1)} \tag{3}$$
$$= \frac{(n+2)(n-1)}{n(n+1)}$$

$$I = \lim_{n \to +\infty} \frac{1 \times 4}{2 \times 3} \frac{2 \times 5}{3 \times 4} \cdots \frac{(n-2)(n+1)}{(n-1)n} \frac{(n-1)(n+2)}{n(n+1)}$$
$$= \lim_{n \to +\infty} \frac{1}{3} \frac{4}{2} \frac{2}{4} \frac{5}{3} \frac{3}{5} \frac{6}{4} \cdots \frac{n+2}{n}$$
$$= \lim_{n \to +\infty} \frac{1}{3} \frac{n+2}{n} \tag{4}$$
$$= \frac{1}{3} \lim_{n \to +\infty} \frac{n+2}{n}$$
$$= \frac{1}{3}$$

Theorem 0.1

任意 n 个非负实数 $a_1, a_2, \ldots, a_n$

$$\frac{a_1 + a_2 + \cdots + a_n}{n} \geq \sqrt[n]{a_1 \ldots a_n} \tag{5}$$

其中等号成立 $\iff a_1 = a_2 = \cdots = a_n$ ♡

Proof   数学归纳法

$n = 1$ 时结论平凡

$n = 2 \qquad \frac{a_1 + a_2}{2} \geq \sqrt{a_1 a_2}$

$$(a_1 - a_2)^2 = a_1^2 - 2a_1 a_2 + a_2^2 \geq 0$$

$$a_1^2 + 2a_1 a_2 + a_2^2 \geq 4a_1 a_2$$

$$(a_1 + a_2)^2 \geq 4a_1 a_2$$

$$\frac{a_1 + a_2}{2} \geq \sqrt{a_1 a_2}$$

$n = k$ 时，假设 $\frac{a_1 + \cdots + a_k}{k} \geq \sqrt[k]{a_1 \ldots a_k}$ 成立

$n = k+1$

$$\frac{a_1 + \cdots + a_k + a_{k+1}}{k+1} - \frac{a_1 + \cdots + a_k}{k}$$
$$= \frac{k(a_1 + \cdots + a_{k+1}) - (k+1)(a_1 + \cdots + a_k)}{k(k+1)} \tag{6}$$
$$= \frac{ka_{k+1} - (a_1 + \cdots + a_k)}{k(k+1)}$$

we found

$$\frac{a_1 + \cdots + a_k + a_{k+1}}{k+1} = \frac{a_1 + \cdots + a_k}{k} + \frac{ka_{k+1} - (a_1 + \cdots + a_k)}{k(k+1)}$$

note

$$A := \frac{a_1 + \cdots + a_k}{k}, \qquad B := \frac{ka_{k+1} - (a_1 + \cdots + a_k)}{k(k+1)}$$

$$(\frac{a_1 + \cdots + a_k + a_{k+1}}{k+1})^{k+1} = (A+B)^{k+1} \geq A^{k+1} + (k+1)A^k B \tag{7}$$

使用二项式展开需要对 a_i 从小到大重排，而使用 Bernoulli 不等式则只需要 $A \geq 0, (A+B) \geq 0$ 即可

$$A^{k+1} + (k+1)A^k B = A^k(A + (k+1)B) \tag{8}$$

$$A^k = (\frac{a_1 + \cdots + a_k + a_{k+1}}{k+1})^{k+1} \geq a_1 \ldots a_k \quad \text{assume at}(n=k)$$

$$A + (k+1)B = \frac{a_1 + \cdots + a_k}{k} + \frac{ka_{k+1} - (a_1 + \cdots + a_k)}{k} = a_{k+1} \tag{9}$$

$$\because (A+B)^{k+1} \geq A^k(A + (k+1)B) \geq a_1 \ldots a_k a_{k+1}$$

$$\therefore \frac{a_1 + \cdots + a_k + a_{k+1}}{k+1} \geq \sqrt[k+1]{a_1 \ldots a_k a_{k+1}}$$

使用二项式展开定理的条件：
在归纳法第二步对 $a_1 \ldots a_{k+1}$ 重编号，使 a_{k+1} 为其中最大的数（之一）
这使得分解式右边第二项 $\frac{ka_{k+1} - (a_1 + \cdots + a_k)}{k(k+1)}$ 一定是非负数

Proof Forward and backward (Cauchy, 1897)

Forward Part:

$n = 2$

$$\frac{a_1 + a_2}{2} \geq \sqrt{a_1 a_2} \tag{10}$$

$n = 4$

$$\frac{a_1 + a_2 + a_3 + a_4}{4} \geq \sqrt{\frac{a_1 + a_2}{2}\frac{a_3 + a_4}{2}}$$
$$\geq \sqrt{\sqrt{a_1 a_2}\sqrt{a_3 a_4}} \tag{11}$$
$$\geq \sqrt[4]{a_1 a_2 a_3 a_4}$$

$n = 2^k$ 假设不等式 $\frac{a_1 + \cdots + a_{2^k}}{2^k} \geq \sqrt[2^k]{a_1 \ldots a_{2^k}}$ 成立

$n = 2^{k+1}$

$$\frac{a_1 + \cdots + a_{2^k} + \cdots + a_{2^{k+1}}}{2^{k+1}} \geq \sqrt{\frac{a_1 + \cdots + a_{2^k}}{2^k}\frac{a_{2^k+1} + \cdots + a_{2^{k+1}}}{2^k}}$$
$$\geq \sqrt{\sqrt[2^k]{a_1 \ldots a_{2^k}}\sqrt[2^k]{a_{2^k+1} \ldots a_{2^{k+1}}}} \tag{12}$$
$$\geq \sqrt[2^{k+1}]{a_1 \ldots a_{2^{k+1}}}$$

Backward Part: A-G 不等式对某个 $n \geq 2$ 成立，则它对 $n-1$ 也成立

$$\frac{1}{n-1}\sum_{i=1}^{n-1}a_i = \frac{1}{n}(\frac{n}{n-1})\sum_{i=1}^{n-1}a_i$$

$$= \frac{1}{n}(\sum_{i=1}^{n-1}a_i + \frac{1}{n-1}\sum_{i=1}^{n-1}a_i) \tag{13}$$

将 $\frac{1}{n-1}\sum_{i=1}^{n-1}a_i$ 看作 a_n

$$\frac{1}{n-1}\sum_{i=1}^{n-1}a_i \geq \sqrt[n]{(\prod_{i=1}^{n-1}a_i)(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)} \tag{14}$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)^n \geq \prod_{i=1}^{n-1}a_i(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i) \tag{15}$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)^{n-1} \geq \prod_{i=1}^{n-1}a_i \tag{16}$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1}a_i \geq \sqrt[n-1]{\prod_{i=1}^{n-1}a_i} \tag{17}$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1}a_i \geq \sqrt[n]{(\prod_{i=1}^{n-1}a_i)(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)} \tag{18}$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)^n \geq \prod_{i=1}^{n-1}a_i(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i) \tag{19}$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1}a_i)^{n-1} \geq \prod_{i=1}^{n-1}a_i \tag{20}$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1}a_i \geq \sqrt[n-1]{\prod_{i=1}^{n-1}a_i} \tag{21}$$

Theorem 0.2

对 $a_1,\ldots,a_n$ 和 $b_1,\ldots,b_n \in \mathbb{R}$，成立

$$|\sum_{i=1}^{n}a_ib_i| \leq \sqrt{\sum_{i=1}^{n}a_i^2}\sqrt{\sum_{i=1}^{n}b_i^2} \tag{22}$$

♡

Proof

$$\sum_{i=1}^{n}(a_i-\lambda b_i)^2 = \sum_{i=1}^{n}a_i^2 - 2\lambda\sum_{i=1}^{n}a_ib_i + \lambda^2\sum_{i=1}^{n}b_i^2 \geq 0$$

由韦达定理（视 λ 为未知数），原方程无解或只有唯一解

$$\Delta = b^2 - 4ac \le 0$$

$$(-2\sum_{i=1}^{n} a_i b_i)^2 - 4\sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2 \le 0$$

$$(\sum_{i=1}^{n} a_i b_i)^2 \le \sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2 \tag{23}$$

$$\sum_{i=1}^{n} a_i b_i \le \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2}$$

> **Theorem 0.3**
>
> 设函数 $f(x), g(x) \in \mathbb{C}[a,b]$. 且在 $[a,b]$ 上不变号，则存在 $\zeta \in [a,b]$，使得 $\int_a^b f(x)g(x) = f(\zeta)\int_a^b g(x)\mathrm{d}x$ ♡

Proof   suppose that $g(x) \ge 0$. $f(x)$ continuous on close set,so we can get the maximum and minimum value of f. We note that m is the minimum value of $f(x), x \in [a,b]$,and M is the maximum value of $f(x)$, then we have:

$$mg(x) \le f(x)g(x) \le Mg(x)$$

$$m\int_a^b g(x)\mathrm{d}x \le \int_a^b f(x)g(x)\mathrm{d}x \le M\int_a^b g(x)\mathrm{d}x$$

note that we don't know$\int_a^b g(x)\mathrm{d}x \ne 0$

When $\int_a^b g(x)\mathrm{d}x = 0$, then $g(x) \equiv 0$, So $\forall \zeta \in [a,b]$, the theorem works.

When $\int_a^b g(x)\mathrm{d}x = 0$, then $m \le \frac{\int_a^b f(x)g(x)dx}{\int_a^b g(x)dx} \le M$

From the Intermediate Value Theorem, $f(x) \in \mathbb{C}[a,b] \quad m \le f(x) \le M$

$$\exists \zeta \in [a,b] \quad f(\zeta) = \frac{\int_a^b f(x)g(x)\mathrm{d}x}{\int_a^b f(x)\mathrm{d}x}$$

$$\int_a^b f(x)g(x)\mathrm{d}x = f(\zeta)\int_a^b g(x)\mathrm{d}x$$

设 $g(x)$ 在 $[a,b]$ 上连续可积，$f(x)$ 在 $[a,b]$ 上连续单调递增，且 $f'(x) \ge 0$，并对 $\forall x \in [a,b]$ 有 $f(x) \ge 0$。则存在 $\zeta \in [a,b]$，使得

$$\int_a^b f(x)g(x)\mathrm{d}x = f(b)\int_\zeta^b g(x)\mathrm{d}x$$

Proof   set$G(x) = \int_x^b g(t)\mathrm{d}t, g(x)$在$[a,b]$ 上可积

则 $G(x), x \in [a,b]$ 存在最值，设最小值和最大值分别为 m, M

$$G(x) = -\int_b^x g(t)\mathrm{d}t, \quad G'(x) = -g(x)$$

$$\int_a^b f(x)g(x)\mathrm{d}x = -\int_a^b f(x)\mathrm{d}G(x)$$

$$= -(f(b)G(b) - f(a)G(a)) - \int_a^b G(x)f'(x)\mathrm{d}x \tag{24}$$

$$= f(a)G(a) + \int_a^b G(x)f'(x)\mathrm{d}x$$

$$m \int_a^b f'(x)\mathrm{d}x \leqslant \int_a^b G(x)f'(x)\mathrm{d}x \leqslant M \int_a^b f'(x)\mathrm{d}x$$

$$m[f(b-f(a))] \leqslant \int_a^b G(x)f'(x)\mathrm{d}x \leqslant M[f(b-f(a))]$$

$$mf(a) \leqslant f(a)G(a) \leqslant Mf(a)$$

$$mf(b) \leqslant \int_a^b f(x)g(x)\mathrm{d}x \leqslant Mf(b)$$

From the Intermediate Value Theorem, $\exists \zeta \in [a,b] s.t. G(\zeta) = \frac{\int_a^b f(x)g(x)\mathrm{d}x}{f(b)}$ then we have

$$\int_a^b f(x)g(x)\mathrm{d}x = f(b)G(\zeta) = f(b)\int_\zeta^b g(x)\mathrm{d}x$$

1.3.2 练习题

1. 关于 Bernoulli 不等式的推广：

(1) 证明：当 $-2 \geq h \geq -1$ 时 Bernoulli 不等式 $(1+h)^n \geq 1+nh$ 仍成立；

(2) 证明：当 $h \geq 0$ 时成立不等式

$$(1+h)^n \geq \frac{n(n-1)h^2}{2} \tag{25}$$

(3) 证明：若 $a_i > -1 \quad (i = 1, 2, \ldots, n)$ 且同号，则成立不等式

solve:

(1)

$$-2 \leq h \leq -1$$

$$-1 \leq 1+h \leq 0$$

$$-1 \leq (1+h)^n \leq 0$$

$$-2n \leq nh \leq -n$$

$$1-2n \leq 1+nh \leq 1-n$$

$n = 0 \quad (1+h)^0 = 1 = 1+0*h$ 结果是平凡的

$n = 1 \quad 1+h = 1+h$ 结果是平凡的

$n \geq 2 \quad$ 此时 $1-n \leq -2$

$$0 \geq (1+h)^n \geq -1 \geq -2 \geq 1-n \geq 1-nh \geq 1-2n$$

$$(1+h)^n \geq 1+nh$$

(2)

$$h \geq 0 \qquad (1+h)^n \geq \frac{n(n-1)h^2}{2}$$

$$(1+h)^n = 1+nh+\frac{n(n-1)}{2}h^2+\cdots \geq \frac{n(n-1)}{2}h^2$$

推广：

$$(1+h)^n \geq C_n^3 h^3, C_n^4 h^4, \ldots, C_n^k h^k, \qquad 0 \leq k \leq n$$

(3)

$$\prod_{i=1}^{n}(1+a_i) \geq 1 + \sum_{i=1}^{n} a_i$$

(a)$a_i \geq 0$, 且同号。

$$\prod_{i=1}^{n}(1+a_i) = 1 + \sum_{i=1}^{n} a_i + \sum_{i=1,i\neq j}^{n}\sum_{j=1}^{n} a_i a_j + \sum_{i=1,i\neq j,k}^{n}\sum_{j=1,j\neq k}^{n}\sum_{k=1}^{n} a_i a_j a_k + \ldots$$

$$\prod_{i=1}^{n}(1+a_i) \geq \frac{\prod_{i=1}^{n}(1+a_i)}{1+a_k} \qquad \forall k \in 1,2,\ldots,n, \quad 1+a_k \geq 1$$

(b) $0 > a_i > -1$此时$1 > 1 + a_i > 0$

别人的方法：$n = 1$ 时不等式变成等式，显然成立

设 $n = k$ 时不等式也成立

$$\prod_{i=1}^{k}(1+a_i) \geq 1 + \sum_{i=1}^{k} a_i$$

则 $n = k+1$ 时，有

$$\prod_{i=1}^{k+1}(1+a_i) = \prod_{i=1}^{k} a_i(1+a_{k+1}) \geq (1 + \sum_{i=1}^{k} a_i)(1+a_{k+1})$$

$$(1 + \sum_{i=1}^{k} a_i)(1+a_{k+1}) = 1 + \sum_{i=1}^{k} a_i + a_{k+1} + \sum_{i=1}^{k} a_i \cdot a_{k+1} \geq 1 + \sum_{i=1}^{k+1} a_i$$

$$\therefore \prod_{i=1}^{k+1}(1+a_i) \geq 1 + \sum_{i=1}^{k+1} a_i$$

2. 利用 A-G 不等式求解下列有关阶乘 $n!$ 的不等式

(1) 证明：当 $n > 1$ 时成立

$$n! < (\frac{n+1}{2})^n \tag{26}$$

(2) 利用 $(n!)^2 = (n \cdot 1)((n-1) \cdot 2) \ldots (1 \cdot n)$ 证明：当 $n > 1$ 时成立

$$n! < (\frac{n+2}{\sqrt{6}})^n \tag{27}$$

(3) 比较 (1)(2) 两个不等式的优劣，并说明原因；

(4) 证明：对任意实数 r 成立

$$(\sum_{k=1}^{n} k^r)^n \geq n^n(n!)^r \tag{28}$$

solve:

(1) when $n > 1$

$$n! = 1 \times 2 \times \cdots \times n < (\frac{1+2+\cdots+n}{n})^n$$

$$(\frac{1+2+\cdots+n}{n})^n = (\frac{n(n+1)}{2n})^n = (\frac{n+1}{2})^n$$

(2) when $n > 1$

$$(n!)^2 = (n \cdot 1)((n-1) \cdot 2) \ldots (1 \cdot n) < (\frac{n \cdot 1 + (n-1) \cdot 2 + \cdots + 1 \cdot n}{n})^n$$

$$n \cdot 1 + (n-1) \cdot 2 + \cdots + 1 \cdot n = \sum_{k=1}^{n} (n-k+1)k$$

$$\begin{aligned}
\sum_{k=1}^{n} (n-k+1)k &= (n+1) \sum_{k=1}^{n} k - \sum_{k=1}^{n} k^2 \\
&= (n+1)\frac{n(n+1)}{2} - \frac{n(2n+1)(n+1)}{6} \\
&= \frac{n(n+1)}{6}(3(n+1) - (2n+1)) \\
&= \frac{n(n+1)(n+2)}{6}
\end{aligned} \tag{29}$$

$$\begin{aligned}
(n!)^2 &= (n \cdot 1)((n-1) \cdot 2) \ldots (1 \cdot n) \\
&< (\frac{n \cdot 1 + (n-1) \cdot 2 + \cdots + 1 \cdot n}{n})^n \\
&= (\frac{1}{n}\frac{n(n+1)(n+2)}{6})^n \\
&= (\frac{(n+1)(n+2)}{6})^n \\
&< (\frac{n+2}{6})^{2n}
\end{aligned} \tag{30}$$

$$\therefore \qquad n! < (\frac{n+2}{\sqrt{6}})^n \tag{31}$$

(3)
$$\frac{n+1}{2} = \frac{n+2}{\sqrt{6}} \tag{32}$$

解得 $n = 1 + \sqrt{6} > 3$, $n > 3$ 时 (2) 式更精确，结果比 (1) 式更好。

(4) $\forall r \in \mathbb{R} \quad (n!)^r \leqslant \frac{1}{n^n}(\sum_{k=1}^{n} k^r)^n$ 由 A-G 不等式

$$\frac{1}{n}\sum_{k=1}^{n} k^r \geq \sqrt[n]{\prod_{k=1}^{n} k^r} \tag{33}$$

$$(n!)^r = \prod_{k=1}^{n} k^r \leqslant (\frac{1}{n}\sum_{k=1}^{n} k^r)^n = \frac{1}{n^n}(\sum_{k=1}^{n} k^r)^n \tag{34}$$

2.(4)

$$\forall r \in \mathbb{R} \qquad (\sum_{i=1}^{n} k^r)^n \geq n^n(n!)^r$$

$$(n!)^r = \prod_{k=1}^{n} k^r \leqslant (\frac{1^r + 2^r + \cdots + n^r}{n})^n = \frac{1}{n^n}(\sum_{k=1}^{n} k^r)^n \quad \text{A-G inequality} \tag{35}$$

$$\therefore (\sum_{k=1}^{n} k^r)^n \geq n^n(n!)^r$$

3. $a_k > 0$, $\quad k = 1, 2, \ldots, n$ 证明几何-调和平均值不等式

$$(\prod_{k=1}^{n} a_k)^{\frac{1}{n}} \geq \frac{n}{\sum_{k=1}^{n} \frac{1}{a_k}} \tag{36}$$

Proof   from A-G inequality

$$\frac{\sum_{k=1}^n \frac{1}{a_k}}{n} \geq \sqrt[n]{\prod_{k=1}^n \frac{1}{a_k}}$$

$$= \frac{1}{\sqrt[n]{\prod_{k=1}^n a_k}} \tag{37}$$

$$\therefore a_k > 0, \qquad \sqrt[n]{\prod_{k=1}^n a_k} \geq \frac{n}{\sum_{k=1}^n \frac{1}{a_k}}$$

4. $a, b, c \geq 0$, proof that

$$\sqrt[3]{abc} \leqslant \sqrt{\frac{ab + bc + ca}{3}} \leq \frac{a+b+c}{3} \tag{38}$$

并推广到 n 个非负数的情况

Proof   left:

$$\sqrt[3]{abc} = \sqrt{\sqrt[3]{ab \cdot bc \cdot ca}}$$

$$\leqslant \sqrt{\frac{ab + bc + ca}{3}} \tag{39}$$

right:

$$\sqrt{\frac{ab + bc + ca}{3}} \leqslant \sqrt{\frac{(\frac{a+b}{2})^2 + (\frac{b+c}{2})^2 + (\frac{c+a}{2})^2}{3}}$$

$$= \sqrt{\frac{2(a^2 + b^2 + c^2) + 2(ab + bc + ca)}{12}} \tag{40}$$

$$= \sqrt{\frac{a^2 + b^2 + c^2 + ab + bc + ca}{6}}$$

$$\because a, b, c \geq 0 \qquad \frac{ab + bc + ca}{3} \leqslant \frac{a^2 + b^2 + c^2 + ab + bc + ca}{6} \tag{41}$$

需要证明 $\sqrt{\frac{ab+bc+ca}{3}} \leq \frac{a+b+c}{3}$
对该式两边平方

$$\frac{ab + bc + ca}{3} \leq \frac{(a+b+c)^2}{9} = \frac{a^2 + b^2 + c^2 + 2ab + 2bc + 2ca}{9} \tag{42}$$

$$\frac{ab + bc + ca}{3} \leqslant \frac{a^2 + b^2 + c^2}{6} + \frac{ab + bc + ca}{6}$$

$$\leqslant \frac{a^2 + b^2 + c^2}{6} + \frac{ab + bc + ca}{3}$$

$$= (\frac{a+b+c}{3})^2 \tag{43}$$

$$\therefore \sqrt{\frac{ab + bc + ca}{3}} \leqslant \frac{a+b+c}{3}$$

Proof   推广至 n 个

$$[l] n = 2 \qquad \sqrt{ab} \qquad \leq \frac{a+b}{2}$$

$$n = 3 \qquad \sqrt[3]{abc} \qquad \leq \sqrt{\frac{ab + bc + ca}{3}} \qquad \leq \frac{a+b+c}{3} \tag{44}$$

$$n = k \qquad \sqrt[k]{\prod_{i=1}^k a_i} \qquad \leq \sqrt{\frac{\sum_{i=1}^k -1 a_i a_{i+1} + a_k a_1}{k}} \qquad \leq \frac{\sum_{i=1}^k a_i}{k}$$

$$1 \qquad \sqrt[k]{a_1 a_2 \ldots a_k} = \sqrt{\sqrt[k]{a_1^2 a_2^2 \ldots a_k^2}} \leq \sqrt{\frac{a_1 a_2 + a_2 a_3 + \ldots a_k a_1}{k}} \tag{45}$$

$$2 \qquad \sqrt{\frac{a_1 a_2 + a_2 a_3 + \ldots a_k a_1}{k}} \leqslant \frac{a_1 + \cdots + a_k}{k} \tag{46}$$

$$\frac{a_1 a_2 + a_2 a_3 + \ldots a_k a_1}{k} \leqslant \frac{a_1^2 + \ldots a_k^2}{2k}$$
$$2 \frac{a_1 a_2 + a_2 a_3 + \ldots a_k a_1}{k} \leqslant \frac{(a_1 + \ldots a_k)^2}{2k} \tag{47}$$
$$\sqrt{\frac{a_1 \ldots a_k}{k}} \leqslant \frac{a_1 + \cdots + a_k}{\sqrt{4k}} \quad \text{wrong!}$$

Chapter 1 第一章

1.1 引论

1.1.1 关于习题课教案的组织

1.1.2 书中常用记号

1. $\mathbf{N}_+$：所有正整数组成的集合.
2. $\mathbf{R}$：所有实数组成的集合 (同时也用于表示无限区间 $(-\infty, \infty)$).
3. $\mathbf{Q}$：所有有理数组成的集合.
4. $\mathbf{C}$：所有复数组成的集合.
5. $\iff$ 是等价关系的记号. $A \iff B$ 表示 A 和 B 等价. 例如，A 代表 $x > 3$，B 代表 $x - 3 > 0$，则 $x > 3 \iff x - 3 > 0$.
6. $[x]$ 是实数 x 的整数部分，即不超过 x 的最大整数. 例如，$[\sqrt{2}] = 1, [-\sqrt{2}] = -2$. 关于 $[x]$ 的基本不等式是：$[x] \leq x < [x] + 1$，或 $x - 1 < [x] \leq x$
7. 空心方块表示一个证明或解的结束.
8. $\binom{n}{k} = C_n^k = \frac{n(n-1)\cdots(n-k+1)}{k!}$.
9. 记号 $\approx$ 表示近似值. 例如 $\sqrt{2} \approx 1.4$.
10. 复合函数 $f(g(x))$ 也写成 $(f \circ g)(x)$ 或 $f \circ g$.
11. 若 A 和 B 为两个集合，则用记号 $A - B$ 或 $A \backslash B$ 表示 A 与 B 的差集，也就是集合 $\{x | x \in A \text{且} x \notin B\}$.
12. 用 $O_\delta(a)$ 表示以 a 为中心，以 $\delta > 0$ 为半径的邻域. 它就是开区间 $(a - \delta, a + \delta)$(也可以用 $U_\delta(a)$ 等记号). 如不必指出半径，则可简记为 $O(a)$ (或 $U(a)$).

1.1.3 几个常用的初等不等式

1.1.3.1 几个初等不等式的证明

A.G 不等式 $a_1, a_2, \cdots, a_n$, n 个非负实数

$$\frac{a_1 + a_2 + \cdots + a_n}{n} \geq \sqrt[n]{a_1 \cdots a_n} \tag{1.1}$$

$\geq$ in inequation became $= \iff a_1 = a_2 = \cdots = a_n$

Proof

method 1. induction method

$$k = 1 \qquad a_1 = a_1$$

$$k = 2 \qquad \frac{a_1 + a_2}{2} \geq \sqrt{a_1 a_2}$$

$$k = n \qquad \text{suppose} \qquad \frac{a_1 + a_2 + \cdots + a_n}{n} \geq \sqrt[n]{a_1 \cdots a_n}$$

$$k = n + 1$$

$$\frac{a_1 + a_2 + \cdots + a_{n+1}}{n+1} - \frac{a_1 + a_2 + \cdots + a_n}{n}$$

$$= \frac{n(a_1 + a_2 + \cdots + a_{n+1}) - (n+1)(a_1 + a_2 + \cdots + a_n)}{n(n+1)}$$

$$= \frac{na_{n+1} - (a_1 + a_2 + \cdots + a_n)}{n(n+1)}$$

Set $A = \frac{a_1 + a_2 + \cdots + a_n}{n}$, $B = \frac{na_{n+1} - (a_1 + a_2 \cdots + a_n)}{n(n+1)}$

$$\left(\frac{a_1 + a_2 + \cdots + a_{n+1}}{n+1}\right)^{n+1} = (A+B)^{n+1}$$

$A > 0, B \geq 0$

$$(A+B)^{n+1} \geq A^{n+1} + (n+1)A^n B$$

$$A^{n+1} + (n+1)A^n B = A^n(A + (n+1)B)$$

$$A^n = \left(\frac{a_1 + a_2 + \cdots + a_n}{n}\right)^n \geq a_1 a_2 \cdots a_n$$

$$A + (n+1)B = \frac{a_1 + a_2 + \cdots + a_n}{n} + \frac{na_{n+1} - (a_1 + a_2 + \cdots + a_n)}{n} = a_{n+1}$$

$$\therefore (A+B)^{n+1} \geq A^n(A + (n+1)B) \geq a_1 a_2 \cdots a_n \cdot a_{n+1}$$

$$\therefore \frac{a_1 + a_2 + \cdots + a_{n+1}}{n+1} \geq \sqrt[n+1]{a_1 a_2 \cdots a_n a_{n+1}}$$

使用二项式展开定理的条件

在归纳法第二步，将 $a_1, a_2, \cdots, a_{n+1}$ 重编号，使得 $n+1$ 为其中最大的数 (之一)，这使得分解式右边第二项 $(na_{n+1} - (a_1 + a_2 + \cdots + a_n))/n(n+1)$ 一定是非负数。

method 2. Forward and Backward (Cauchy, 1897)

Forward part

$$k = 2. \frac{a_1 + a_2}{2} \geq \sqrt{a_1 a_2}.$$

$$k = 4. \frac{a_1 + a_2 + a_3 + a_4}{4} \geq \sqrt{\left(\frac{a_1 + a_2}{2}\right) \cdot \left(\frac{a_3 + a_4}{2}\right)}.$$

$$\geq \sqrt{\sqrt{a_1 a_2} \sqrt{a_3 a_4}} = \sqrt[4]{a_1 a_2 a_3 a_4}.$$

$$k = 2^n. \text{Suppose} \quad \frac{a_1 + a_2 + \cdots a_{2^n}}{2^n} \geq \sqrt[2^n]{a_1 a_2 \cdots a_{2^n}}$$

$$k = 2^{n+1}.$$

$$\frac{a_1 + a_2 + \cdots + a_{2^n} + \cdots + a_{2^{n+1}}}{2^{n+1}} \geq \sqrt{\left(\frac{a_1 + a_2 + \cdots + a_2^n}{2^n}\right) \cdot \left(\frac{a_{2^n+1} + a_{2^n+2} + \cdots + a_2^{n+1}}{2^n}\right)}$$

$$I \geq \sqrt{\sqrt[2^n]{a_1 a_2 \cdots a_{2^n}} \sqrt[2^n]{a_{2^n+1} a_{2^n+2} \cdots a_{2^{n+1}}}} = \sqrt[2^{n+1}]{a_1 a_2 \cdots a_{2^{n+1}}}$$

Backward part suppose A.G inequality is valid when $k = n$, Consider $k = n - 1$.

$$\frac{1}{n-1}\sum_{i=1}^{n-1} a_i = \frac{1}{n}(\frac{n}{n-1})\sum_{i=1}^{n-1} a_i$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1} a_i = \frac{1}{n}(\sum_{i=1}^{n-1} a_i + \frac{1}{n-1}\sum_{i=1}^{n-1} a_i)$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1} a_i \geq \sqrt[n]{(\prod_{i=1}^{n-1} a_i)(\frac{1}{n-1}\sum_{i=1}^{n-1} a_i)}$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1} a_i)^n \geq (\prod_{i=1}^{n-1} a_i)(\frac{1}{n-1}\sum_{i=1}^{n-1} a_i)$$

$$(\frac{1}{n-1}\sum_{i=1}^{n-1} a_i)^{n-1} \geq (\prod_{i=1}^{n-1} a_i)$$

$$\frac{1}{n-1}\sum_{i=1}^{n-1} a_i \geq \sqrt[n-1]{\prod_{i=1}^{n-1} a_i}$$

Proposition 1.1 (1.3.5)

柯西-施瓦茨不等式对 $a_1, a_2, \cdots, a_n$ 和 $b_1, b_2, \cdots, b_n$，成立 ♠

$$|\sum_{i=1}^{n} a_i b_i \leq \sqrt{\sum_{i=1}^{n} a_i^2}\sqrt{\sum_{i=1}^{n} b_i^2}|$$

Proof

$$0 \leq \sum_{i=1}^{n}(a_i - \lambda b_i)^2 = \sum_{i=1}^{n} a_i^2 - 2\lambda\sum_{i=1}^{n} a_i b_i + \lambda^2\sum_{i=1}^{n} b_i^2$$

由韦达定理 (视 λ 为未知数). 原方程无解或只有唯一解。

$$\Delta = b^2 - 4ac \leq 0$$

$$(-2\sum_{i=1}^{n} a_i b_i)^2 - 4\sum_{i=1}^{n} a_i^2\sum_{i=1}^{n} b_i^2 \leq 0$$

$$(\sum_{i=1}^{n} a_i b_i)^2 \leq \sum_{i=1}^{n} a_i^2\sum_{i=1}^{n} b_i^2$$

$$\sum_{i=1}^{n} a_i b_i \leq \sqrt{\sum_{i=1}^{n} a_i^2}\sqrt{\sum_{i=1}^{n} b_i^2}$$

1.1.3.2 练习题

Example 1.1 关于 Bernoulli 不等式的推广：

(1) 证明: 当 $-2 \leq h \leq -1$ 时 Bernoulli 不等式 $(1+h)^n \geq 1 + nh$ 仍成立;

(2) 证明: 当 $h \geq 0$ 时成立不等式 $(1+h)^n \geq \frac{n(n-1)h^2}{2}$, 并推广之;

(3) 证明: 若 $a_i > -1(i = 1, 2, \ldots, n)$ 且同号, 则成立不等式

$$\prod_{i=1}^{n}(1 + a_i) \geq 1 + \sum_{i=1}^{n} a_i$$

Proof (1)

$$-2 \le h \le -1$$

$$-1 \le 1+h \le 0 \qquad\qquad -1 \le (1+h)^n \le 0$$

$$-2n \le nh \le -n \qquad\qquad 1-2n \le 1+nh \le 1-n$$

$$n = 0. \qquad\qquad (1+h)^0 = 1 = 1 + 0 \times h$$

$$n = 1. \qquad\qquad 1+h = 1+h$$

$$n \ge 2. \qquad\qquad 1-n \le -2$$

$$0 \ge (1+h)^n \ge -1 \ge -2 \ge 1-n \ge 1+nh \ge 1-2n$$

$$(1+h)^n \ge 1+nh$$

(2)

$$h \ge 0$$

$$(1+h)^n = 1 + nh + \frac{n(n-1)}{2}h^2 + \cdots \ge \frac{n(n-1)}{2}h^2$$

推广:

$$(1+h)^n \ge \binom{n}{3}h^3, \binom{n}{4}h^4, \ldots, \binom{n}{k}h^k, 0 \le k \le n$$

(3) $k = 1$ 时显然成立. 使用归纳法证明. 假设 $k = n$ 时不等式 $\prod_{i=1}^{n}(1+a_i) \ge 1 + \sum_{i=1}^{n} a_i$ 成立, 证明 $k = n+1$ 时 $\prod_{i=1}^{n+1}(1+a_i) \ge 1 + \sum_{i=1}^{n+1} a_i$ 成立.

$$k = n+1 \qquad \prod_{i=1}^{n+1}(1+a_i) = \prod_{i=1}^{n}(1+a_i)(1+a_{n+1})$$

$$\because \prod_{i=1}^{n}(1+a_i) \ge 1 + \sum_{i=1}^{n} a_i$$

$$\prod_{i=1}^{n}(1+a_i)(1+a_{n+1}) \ge (1 + \sum_{i=1}^{n} a_i)(1+a_{n+1})$$

$$(1 + \sum_{i=1}^{n} a_i)(1+a_{n+1}) = 1 + \sum_{i=1}^{n} a_i + a_{n+1} + a_{n+1}\sum_{i=1}^{n} a_i$$

$$= 1 + \sum_{i=1}^{n+1} a_i + a_{n+1}\sum_{i=1}^{n} a_i$$

$$\ge 1 + \sum_{i=1}^{n+1} a_i$$

Example 1.2 利用 **A.G.** 不等式求解:

(1). $n! \le (\frac{n+1}{2})^n$, while $n > 1$

(2). $(n!)^2 = (n \cdot 1)[(n-1) \cdot 2]\ldots(1 \cdots n)$. 证明: 当 $n > 1$ 时成立

$$n! < (\frac{n+2}{6})^n$$

(3). 比较上述两个不等式的优劣

(4). 证明: 对任意实数 r 成立:

$$(n!)^r \le \frac{1}{n^n}(\sum_{k=1}^{n} k^r)^n \tag{1.2}$$

Proof   (1).

$$n > 1 \qquad n! = 1 \times 2 \times \cdots \times n < (\frac{1 + 2 + \cdots + n}{n})^n = (\frac{(1+n)n}{2n})^n = (\frac{n+1}{2})^n$$

$\because 1 \neq 2 \neq \cdots n,$ 所以不会有等号出现的情况

(2). $n > 1$

$$(n!)^2 = (n \cdot 1)[(n-1) \cdot 2] \ldots (1 \cdots n)$$
$$< (\frac{n \times 1 + (n-1) \times 2 + \cdots + 1 \times n}{n})^n$$

Consider this equation

$$(\frac{n \times 1 + (n-1) \times 2 + \cdots + 1 \times n}{n})^n \qquad (1.3)$$

$$\sum_{k=1}^{n} (n-k+1)k = (n+1) \sum_{k=1}^{n} k - \sum_{k} k^2$$
$$= (n+1) \frac{(n+1)n}{2} - \frac{n(n+1)(2n+1)}{6}$$
$$= \frac{n(n+1)}{6} (3(n+1) - (2n+1))$$
$$= \frac{n(n+1)(n+2)}{6}$$
$$(n!)^2 < (\frac{n \times 1 + (n-1) \times 2 + \cdots + 1 \times n}{n})^n$$
$$= (\frac{(n+1)(n+2)}{6})^n$$

$\because n+1 < n+2, \therefore n! < (\frac{n+2}{\sqrt{6}})^n$

(3). $n > 3$ 时,$\frac{n+2}{\sqrt{6}} < \frac{n+1}{2}$ (2) 的结果较好.

(4).$\forall r \in \mathbb{R},$ prove formula 1.2

$$\frac{1}{n} \sum_{k=1}^{n} k^r \geq \sqrt[n]{\prod_{k=1}^{n} k^r}$$
$$(n!)^r = \prod_{k=1}^{n} k^r \leq (\frac{1}{n} \sum_{k=1}^{n} k^r)^n = \frac{1}{n^n} (\sum_{k=1}^{n} k^r)^n$$

my answer

$$\forall r \in \mathbb{R}, \qquad (\sum_{k=1}^{n} k^r)^n \geq n^n (n!)^r$$
$$(n!)^r = \sum_{k=1}^{n} k^r \leq (\frac{1^r + 2^r + \cdots + n^r}{n})^n = \frac{1}{n^n} (\sum_{k=1}^{n} k^r)^n$$
$$\therefore \quad (\sum_{k=1}^{n} k^r)^n \geq n^n (n!)^r$$

Example 1.3 $a_k > 0, k = 1, 2, \ldots, n$ 证明几何–调和平均值不等式

$$(\prod_{k=1}^{n} a_k)^{\frac{1}{n}} \geq \frac{n}{\sum_{k=1}^{n} \frac{1}{a_k}}$$

Proof   from A.G inequality

$$\frac{\sum_{k=1}^{n} \frac{1}{a_k}}{n} \geq \sqrt[n]{\prod_{k=1}^{n} \frac{1}{a_k}} = \frac{1}{\sqrt[n]{\prod_{k=1}^{n} a_k}}$$

$$a_k > 0, \quad \sqrt[n]{\prod_{k=1}^{n} a_k} \geq \frac{n}{\sum_{k=1}^{n} \frac{1}{a_k}}$$

Example 1.4 $a, b, c \geq 0$. prove $\sqrt[3]{abc} \leq \sqrt{\frac{ab+bc+ca}{3}} \leq \frac{a+b+c}{3}$. 并推广到 n 个非负数的情况

Proof 1. $\sqrt[3]{abc} = \sqrt{\sqrt[3]{ab \cdot bc \cdot ca}} \leq \sqrt{\frac{ab+bc+ca}{3}}$.

2.

$$\sqrt{\frac{ab+bc+ca}{3}} \leq \sqrt{\frac{(\frac{a+b}{2})^2 + (\frac{b+c}{2})^2 + (\frac{c+a}{2})^2}{3}}$$

$$= \sqrt{\frac{2(a^2+b^2+c^2) + 2(ab+bc+ca)}{12}}$$

$$= \sqrt{\frac{a^2+b^2+c^2+ab+bc+ca}{6}}$$

$a, b, c \geq 0$, 希望证明

$$\sqrt{\frac{ab+bc+ca}{3}} \leq \frac{a+b+c}{3}$$

$$\frac{ab+bc+ca}{3} \leq \frac{a^2+b^2+c^2}{6} + \frac{ab+bc+ca}{6}$$

$$\frac{ab+bc+ca}{2} \leq \frac{a^2+b^2+c^2}{6} + 2\frac{ab+bc+ca}{6} \qquad (\text{add} \frac{ab+bc+ca}{6})$$

$$\frac{ab+bc+ca}{3} \leq \frac{ab+bc+ca}{2} \leq (\frac{a+b+c}{3})^2$$

$$\sqrt{\frac{ab+bc+ca}{3}} \leq \frac{a+b+c}{3}$$

推广至 n 个

$$[l]n = 2 \qquad \sqrt{ab} \leq \frac{a+b}{2}$$

$$n = 3 \qquad \sqrt[3]{abc} \leq \sqrt{\frac{ab+bc+ca}{3}} \leq \frac{a+b+c}{3}$$

$$n = 4 \qquad \sqrt[4]{abcd} \leq \sqrt[3]{\frac{abc+bcd+cda+dab}{4}} \leq \sqrt{\frac{a+b+c}{3}} \leq \frac{a+b+c+d}{4}$$

$$k = n \qquad \sqrt[n]{a_1 a_2 \ldots a_n} \leq \sqrt{\frac{a_1+a_2+\cdots+a_n}{n}} \leq \frac{a_1+a_2+\cdots+a_n}{n}$$

This is

$$\sqrt[n]{\sum_{k=1}^{n} a_k} \leq \sqrt{\frac{\sum_{k=1}^{n} a_k}{k}} \leq \frac{\sum_{k=1}^{n} a_k}{k}$$

1. $\sqrt[n]{a_1 a_2 \ldots a_n} = \sqrt{\sqrt[n]{a_1^2 a_2^2 \ldots a_n^2}} \leq \sqrt{\frac{a_1 a_2 + a_2 a_3 + \cdots + a_n a_1}{n}}$

2. $\sqrt{\frac{a_1 a_2 + a_2 a_3 + \cdots + a_n a_1}{n}} \leq \sqrt{\frac{a_1 + a_2 + \cdots + a_n}{n}}$?

Example 1.5 (1) $|\alpha + \beta| \leq |\alpha| + |\beta|$

Proof let $\alpha = a - b, \beta = b$, the identity became $|(a-b) + b| \leq |a-b| + |b|$. This is $|a - b| \geq |a| - |b|$.

$$||a| - |b|| = \begin{cases} |a| - |b|. & a \geq b \\ |b| - |a|. & a < b \end{cases}$$

When $a \geq b$, $||a| - |b|| = |a| - |b|$. There is $|a-b| \geq |a| - |b| = ||a| - |b||$

When $a < b$, $|a - b| = |b - a| \geq |b| - |a| = ||a| - |b||$.

$\therefore$, We have $|a-b| \geq ||a| - |b||$

(2) $\sum |a_k| \geq |\sum a_k|$

Proof   We can prove this statement by induction.

$$k = 2, \qquad |a_1| + |a_2| \ge |a_1 + a_2|$$

$$k = 3, \qquad |a_1| + |a_2| + |a_3| \ge |a_1 + a_2 + a_3|$$

$$\text{Suppose } k = n, \qquad \sum_{k=1}^{n} |a_k| \ge |\sum_{k=1}^{n} a_k|$$

$$k = n + 1, \qquad \text{prove} \sum_{k=1}^{n+1} |a_k| \ge |\sum_{k=1}^{n+1} a_k|$$

$$\sum_{k=1}^{n+1} |a_k| = \sum_{k=1}^{n} |a_k| + |a_{n+1}|$$

$$\ge |\sum_{k=1}^{n} a_k| + |a_{n+1}|$$

$$\ge |\sum_{k=1}^{n+1} a_k|$$

$$k = 2, \qquad |a_1| - |a_2| \le |a_1 - a_2|$$

$$\text{Suppose } k = n, \qquad |a_1| - \sum_{k=2}^{n} |a_k| \le |\sum_{k=1}^{n} a_k|$$

$$k = n + 1, \qquad \text{prove} |a_1| - \sum_{k=2}^{n+1} |a_k| \le |\sum_{k=1}^{n+1} a_k|$$

$$|a_1| - \sum_{k=2}^{n+1} |a_k| = |a_1| - \sum_{k=2}^{n} |a_k| - |a_{n+1}|$$

$$\le |\sum_{k=1}^{n} a_k| - |a_{n+1}|$$

$$\le |\sum_{k=1}^{n+1} a_k|$$

Can left side became $||a_1| - \sum_{k=2}^{n} |a_k||$?

$$\left| |a_1| - \sum_{k=2}^{n} |a_k| \right| = |a_1| - \sum_{k=2}^{n} |a_k| \qquad |a_1| \ge \sum_{k=2}^{n} a_k \tag{1.4}$$

$$\left| |a_1| - \sum_{k=2}^{n} |a_k| \right| = \sum_{k=2}^{n} |a_k| - |a_1| \qquad |a_1| \ge \sum_{k=2}^{n} a_k \tag{1.5}$$

in eq1.4, the inequality is still vaild. However in eq1.5, $\sum_{k=2}^{n} |a_k| - |a_1|$ and $|a_1|$

(3). $\frac{|a+b|}{1+|a+b|} \le \frac{|a|}{1+|a|} + \frac{|b|}{1+|b|}$

Proof

$$\frac{|a+b|}{1+|a+b|} \leq \frac{|a|}{1+|a|} + \frac{|b|}{1+|b|}$$

$$\frac{|a+b|}{1+|a+b|} \leq \frac{|a|+|b|+2|a||b|}{(1+|a|)(1+|b|)}$$

$$1 - \frac{|a+b|}{1+|a+b|} \geq 1 - \frac{|a|+|b|+2|a||b|}{(1+|a|)(1+|b|)}$$

$$\frac{1}{1+|a+b|} \geq \frac{1-|a||b|}{(1+|a|)(1+|b|)}$$

$$1 + |a| + |b| + |a||b| \geq 1 + |a+b| - |a||b| - |a||b||a+b|$$

$$|a| + |b| + 2|a||b| + |a||b||a+b| > 0, \text{Since } + 2|a||b| + |a||b||a+b| \geq |a+b|$$

Therefore $\frac{|a+b|}{1+|a+b|} \leq \frac{|a|}{1+|a|} + \frac{|b|}{1+|b|}$

Example 1.6 (4). $|(a+b)^n - a^n| \leq (|a|+|b|)^n - |a|^n$

$$(a+b)^n - a^n = \binom{n}{1}a^{n-1}b^1 + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n}a^0b^n$$

$$(|a|+|b|)^n - |a|^n = \binom{n}{1}|a|^{n-1}|b|^1 + \binom{n}{2}|a|^{n-2}|b|^2 + \cdots + \binom{n}{n}|a|^0|b|^n$$

$$\because |a|^j|b|^k \geq a^j b^k$$

$$\therefore \sum |a|^j|b|^k \geq |\sum a^j b^k|$$

$$|(a+b)^n - a^n| = \begin{cases} (a+b)^n - a^n, & a+b \geq a; b \geq 0 \\ a^n - (a+b)^n, & a+b < a; b < 0 \end{cases}$$

$$|(a+b)^n - a^n| \leq (|a|+|b|)^n - |a|^n. \tag{1.6}$$

Proposition 1.2

1.3.5(Cauchy inequality)

For $a_1, a_2, \ldots, a_n$. and $b_1, b_2, \ldots, b_n$. $a_i, b_i \in \mathbb{R}$, There is

$$\left| \sum_{i=1}^{n} a_i b_i \right| \leq \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2} \tag{1.7}$$

♠

Proof Let's prove eq1.7

First way on book:

Use variable λ, change the inequality into nonnegative binomial.

$$0 \leq \sum_{i=1}^{n}(a_i - \lambda b_i)^2 \qquad = \sum_{i=1}^{n}a_i^2 - 2\lambda \sum_{i=1}^{n}a_i b_i + \lambda^2 \sum_{i=1}^{n}$$

$$\Delta = B^2 - 4AC \qquad = (-2\sum_{i=1}^{n}a_i b_i)^2 - 4(\sum_{i=1}^{n}a_i^2)(\sum_{i=1}^{n}b_i^2) \leq 0$$

$$(\sum_{i=1}^{n}a_i b_i)^2 \leq (\sum_{i=1}^{n}a_i^2)(\sum_{i=1}^{n}b_i^2)$$

sqrt on both side of the inequality above, we can get

$$\left| \sum_{i=1}^{n} a_i b_i \right| \leq \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2}$$

6. Cauchy 不等式的不同证明

(1). 数学归纳法.

$$k = 1, \quad |ab| = \sqrt{a^2}\sqrt{b^2}$$

$$k = 1, \quad |a_1 b_1 + a_2 b_2| = \sqrt{a_1^2 + a_2^2}\sqrt{b_1^2 + b_1^2}$$

$$\text{Suppose } k = n, \quad |\sum_{i=1}^{n} a_i b_i| = \sqrt{\sum_{i=1}^{n} a_i}\sqrt{\sum_{i=1}^{n} b_i}$$

$$k = n+1, \quad |\sum_{i=1}^{n+1} a_i b_i| = |\sum_{i=1}^{n} a_i b_i + a_{n+1} b_{n+1}|$$

$$|\sum_{i=1}^{n+1} a_i b_i| = |\sum_{i=1}^{n} a_i b_i + a_{n+1} b_{n+1}|$$

$$\leq |\sqrt{\sum_{i=1}^{n} a_i}\sqrt{\sum_{i=1}^{n} b_i} + a_{n+1} b_{n+1}|$$

Note that $A = \sqrt{\sum_{i=1}^{n} a_i}$, $B = \sqrt{\sum_{i=1}^{n} b_i}$

$$|\sum_{i=1}^{n+1} a_i b_i| \leq |AB + a_{n+1} b_{n+1}|$$

$$\leq \sqrt{A^2 + a_{n+1}^2}\sqrt{B^2 + b_{n+1}^2}$$

$$= \sqrt{\sum_{i=1}^{n} a_i^2}\sqrt{\sum_{i=1}^{n} b_i^2}$$

(2) Lagrange 恒等式

$$\sum_{i=1}^{n} a_k^2 \sum_{i=1}^{n} b_k^2 - (\sum_{i=1}^{n} |a_k b_k|) = \frac{1}{2}\sum_{i=1}^{n}\sum_{k=1}^{n}(|a_k||b_i| - |a_i||b_k|)^2 \tag{1.8}$$

$$(|a_k||b_i| - |a_i||b_k|)^2 = |a_k|^2|b_i|^2 - 2|a_i||a_k||b_i||b_k| + |b_k|^2|a_i|^2$$

$$= a_k^2 b_i^2 + b_k^2 a_i^2 - 2|a_i a_k b_i b_k|$$

$$\sum_{i=1}^{n}\sum_{k=1}^{n}(|a_k||b_i| - |a_i||b_k|)^2 = 2\sum_{i=1}^{n} a_i^2 \sum_{k=1}^{n} b_k^2 - 2\sum_{i=1}^{n}\sum_{k=1}^{n}|a_i a_k b_i b_k|$$

$$\sum_{i=1}^{n} a_k^2 \sum_{i=1}^{n} b_k^2 - (\sum_{i=1}^{n} |a_k b_k|) = \frac{1}{2}\sum_{i=1}^{n}\sum_{k=1}^{n}(|a_k||b_i| - |a_i||b_k|)^2 \geq 0$$

$$\therefore (\sum_{i=1}^{n} |a_i b_i|)^2 \leq \sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2$$

$$\because |\sum_{i=1}^{n} a_i b_i| \leq \sum_{i=1}^{n} |a_i b_i|$$

$$\therefore (|\sum_{i=1}^{n} a_i b_i|)^2 \leq (\sum_{i=1}^{n} |a_i b_i|)^2$$

$$\therefore (|\sum_{i=1}^{n} a_i b_i|)^2 \leq \sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2$$

不等式两边开平方，得到：

$$|\sum_{i=1}^{n} a_i b_i| \leq \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2}$$

(3). 用不等式 $|AB| \leq \frac{A^2+B^2}{2}$

$$|a_i b_i| \leq \frac{a_i^2 + b_i^2}{2}$$

$$|\sum_{i=1}^{n} a_i b_i| \leq \sum_{i=1}^{n} |a_i b_i| \qquad\qquad \leq \frac{\sum_{i=1}^{n} a_i^2 + \sum_{i=1}^{n} b_i^2}{2}$$

$$\frac{\sum_{i=1}^{n} a_i^2 + \sum_{i=1}^{n} b_i^2}{2} \geq \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2} \qquad\qquad ??$$

如何用均值不等式证明 Cauchy 不等式？

由切比雪夫不等式，有

$$\frac{a_1 b_1 + a_2 b_2 + \cdots + a_n b_n}{n} \leq (\frac{a_1 + a_2 + \cdots + a_n}{n})(\frac{b_1 + b_2 + \cdots + b_n}{n}) \tag{1.9}$$

由均值不等式，有

$$\frac{a_1 + a_2 + \cdots + a_n}{n} \leq \sqrt{\frac{a_1^2 + a_2^2 + \cdots + a_n^2}{n}}$$

$$\frac{b_1 + b_2 + \cdots + b_n}{n} \leq \sqrt{\frac{b_1^2 + b_2^2 + \cdots + b_n^2}{n}}$$

$$\therefore \frac{a_1 b_1 + a_2 b_2 + \cdots + a_n b_n}{n} \leq (\frac{a_1 + a_2 + \cdots + a_n}{n})(\frac{b_1 + b_2 + \cdots + b_n}{n})$$

$$\leq \sqrt{\frac{a_1^2 + a_2^2 + \cdots + a_n^2}{n}} \sqrt{\frac{b_1^2 + b_2^2 + \cdots + b_n^2}{n}}$$

$$= \frac{1}{n} \sqrt{a_1^2 + a_2^2 + \cdots + a_n^2} \sqrt{b_1^2 + b_2^2 + \cdots + b_n^2}$$

This is

$$\sum_{i=1}^{n} a_i b_i \leq \sqrt{\sum_{i=1}^{n} a_i^2} \sqrt{\sum_{i=1}^{n} b_i^2}$$

Square on both side of the inequality, The calculate square root. We can get eq1.9:

(4). 构造复的辅助数列

$$c_k = a_k^2 - b_k^2 + 2\text{ß}|a_k b_k|, \qquad k = 1, 2, \ldots, n$$

Then we use

$$\left| \sum_{k=1}^{n} c_k \right| \leq \sum_{k=1}^{n} |c_k|$$

Solve 1

$$c_k = (|a_k| + \text{ß}|b_k|)^2 = a_k^2 + b_k^2 + 2\text{ß}|a_k b_k|$$

$$\sum_{k=1}^{n} c_k = \sum_{k=1}^{n} a_k^2 + \sum_{k=1}^{n} b_k^2 + 2\text{ß} \sum_{k=1}^{n} |a_k b_k|$$

$$|c_k| = \sqrt{\Re^2 c_k + \Im^2 c_k} = \sqrt{(a_k^2 - b_k^2)^2 + (2a_k b_k)^2} = a_k^2 + b_k^2$$

$$\therefore \left| \sum_{k=1}^{n} a_k^2 + \sum_{k=1}^{n} b_k^2 + 2\text{ß} \sum_{k=1}^{n} |a_k b_k| \right| = \sqrt{\Re^2 \sum_{k=1}^{n} c_k + \Im^2 \sum_{k=1}^{n} c_k}$$

$$= \sqrt{(\sum_{k=1}^{n}(a_k^2 - b_k^2))^2 + \sum_{k=1}^{n}(2a_k b_k)^2}$$

$$= \sqrt{(\sum_{k=1}^{n} a_k^2)^2 + (\sum_{k=1}^{n} a_k^2)^2 - 2(\sum_{k=1}^{n} a_k^2)(\sum_{k=1}^{n} a_k^2) + 4\sum_{k=1}^{n}(a_k b_k)^2}$$

$$\because |\sum c_k| \leq \sum |c_k|$$

$$\therefore (\sum_{k=1}^{n} a_k^2)^2 + (\sum_{k=1}^{n} a_k^2)^2 - 2(\sum_{k=1}^{n} a_k^2)(\sum_{k=1}^{n} a_k^2) + 4\sum_{k=1}^{n}(a_k b_k)^2 \leq (\sum_{k=1}^{n} a_k^2 + \sum_{k=1}^{n} b_k^2)^2$$

$$\therefore 4(\sum_{k=1}^{n} a_k b_k)^2 \leq 4(\sum_{k=1}^{n} a_k^2)(\sum_{k=1}^{n} b_k^2)$$

extracting both side: $\left| \sum_{k=1}^{n} a_k b_k \right| \leq \sqrt{\sum_{k=1}^{n} a_k^2} \sqrt{\sum_{k=1}^{n} b_k^2}$

Example 1.7 7. Suppose $0 < x_i \leq \frac{1}{2}, i = 1, 2, \ldots, n$, then

$$\frac{\prod_{i=1}^{n} x_i}{(\sum_{i=1}^{n} x_i)^n} \leq \frac{\prod_{i=1}^{n}(1 - x_i)}{(\sum_{i=1}^{n}(1 - x_i))^n} \tag{1.10}$$

Proof   Let's prove eq1.10 by induction method.

$$n = 2, \qquad \frac{x_1 x_2}{(x_1 + x_2)^2} \leq \frac{(1 - x_1)(1 - x_2)}{((1 - x_1) + (1 - x_2))^2}$$

$$\frac{(x_1 x_2)}{(x_1^2 + 2x_1 x_2 + x_2^2)} \leq \frac{1 - x_1 - x_2 + x_1 x_2}{(1 - x_1)^2 + 2(1 - x_1)(1 - x_2) + (1 - x_2)^2}$$

$$\frac{(x_1 + x_2)^2}{(x_1 x_2)} \geq \frac{((1 - x_1)(1 - x_2))^2}{1 - x_1 - x_2 + x_1 x_2}$$

$$\frac{x_1}{x_2} + 2 + \frac{x_2}{x_1} \geq \frac{1 - x_1}{1 - x_2} + 2\frac{1 - x_2}{1 - x_1}$$

$$\frac{x_1}{x_2} - \frac{1 - x_1}{1 - x_2} \geq \frac{1 - x_2}{1 - x_1} - \frac{x_2}{x_1}$$

$$\frac{x_1(1 - x_2) - x_2(1 - x_1)}{x_2(1 - x_2)} \geq \frac{x_1(1 - x_2) - x_2(1 - x_1)}{x_1(1 - x_1)}$$

$$\frac{x_1 - x_2}{x_2(1 - x_2)} \geq \frac{x_1 - x_2}{x_1(1 - x_1)}$$

$f(x) = x - x^2, f'(x) = 1 - 2x > 0, \text{ while } x \in (0, \frac{1}{2})$

When $x_1 > x_2, 0 < x_2 < x_1 \leq \frac{1}{2}, x_1 - x_1^2 \geq x_2 - x_2^2, x_1 - x_2 > 0$

When $x_1 < x_2, 0 < x_1 < x_2 \leq \frac{1}{2}, x_1 - x_1^2 \leq x_2 - x_2^2, x_1 - x_2 < 0$

$$\frac{x_1 - x_2}{x_2(1 - x_2)} \geq \frac{x_1 - x_2}{x_1(1 - x_1)}$$

$$k = 2, \qquad \frac{x_1 x_2}{(x_1 + x_2)^2} \leq \frac{(1 - x_1)(1 - x_2)}{((1 - x_1) + (1 - x_2))^2}$$

$$k = 4, \qquad \frac{x_1 x_2 x_3 x_4}{(x_1 + x_2 + x_3 + x_4)^2} \leq \frac{(1 - x_1)(1 - x_2)(1 - x_3)(1 - x_4)}{((1 - x_1) + (1 - x_2) + (1 - x_3) + (1 - x_4))^2}$$

Use Cauchy's forward and backward method, We can prove this equation

Suppose $k = n$, $\dfrac{\prod_{i=1}^{n} x_i}{(\sum_{i=1}^{n} x_i)^2} \leq \dfrac{\prod_{i=1}^{n}(1 - x_i)}{(\sum_{i=1}^{n}(1 - x_i))^2}$

$$k = n - 1, \qquad \text{prove } \frac{\prod_{i=1}^{n-1} x_i}{(\sum_{i=1}^{n-1} x_i)^2} \leq \frac{\prod_{i=1}^{n-1}(1 - x_i)}{(\sum_{i=1}^{n-1}(1 - x_i))^2}$$

todo! need to complete!

> **Proposition 1.3**
>
> Suppose that $h > -1, n \in \mathbb{N}$, Then:
> $$(1+h)^n \geq 1 + nh \tag{1.11}$$
>
> When $n > 1$, the inequality became equation iff $h = 0$.

Proof When $n = 1$, $1 + h = 1 + h$

$h = 0$, $1^n = 1$

Let's consider the condition $n > 1, h \neq 0$.

i). $h > 0$, $(1+h)^n = \binom{n}{0}h^0 + \binom{n}{1}h^1 + \binom{n}{2}h^2 + \cdots + \binom{n}{n}h^n$.

$\because \binom{n}{2}h^2 + \cdots + \binom{n}{n}h^n > 0$, $\therefore (1+h)^n > 1 + nh$

ii). $-1 < h < 0, 0 < 1 + h < 1$.

$$(1+h)^n - 1 = (1 + h - 1)\Big(1 + (1+h) + (1+h)^2 + \cdots + (1+h)^{n-1}\Big)$$
$$= h\Big(1 + (1+h) + (1+h)^2 + \cdots + (1+h)^{n-1}\Big)$$

$\because 1 + (1+h) + (1+h)^2 + \cdots + (1+h)^{n-1} < n$ when $h < 0$

$\therefore (1+h)^n > 1 + nh$

Two variable extension of the Bernoulli inequality, Suppose $h = \frac{B}{A}, A > 0, A + B > 0$, Then $1 + h > 0$ is established.

> **Proposition 1.4**
>
> Suppose $A > 0, A + B > 0, n \in \mathbb{N}$, Then the inequality is true:
> $$(A+B)^n \geq A^n + nA^{n-1}B \tag{1.12}$$
>
> The inequalty became equation iff $B = 0$.

Proof divide A^n on both side of the inequality 1.12. Set $h = \frac{B}{A}(A > 0)$, Then the inequality became Eq 1.11. So we can prove Eq 1.12 by prove Eq 1.11. Eq 1.11 is true when $h > -1$. $\therefore 1 + h > 0, 1 + \frac{B}{A} > 0, \because A > 0$, $\therefore A + B > 0$. And when $n > 1$ the equation is true iff $h = 0. \frac{B}{A} = 0, \therefore B = 0$.

Example 1.8 Ex 1.3.2 exercise 8

$a, c, t, g \geq 0, a + c + t + g = 1$. Prove that $a^2 + c^2 + t^2 + g^2 \geq \frac{1}{4}$.

The inequality became equatio iff $a = c = t = g = \frac{1}{4}$.

Proof from A.G inequality,
$$\frac{a+c+t+g}{4} \geq \sqrt[4]{actg}, \quad a + c + t + g = 1 \tag{1.13}$$

$\therefore \sqrt[4]{actg} \leqslant \frac{1}{4}$

$$a + c + t + g = 1, (a + c + t + g)^2 = 1$$

$$(a+c+t+g)^2 = a^2 + c^2 + t^2 + g^2 + 2ac + 2at + 2ag + 2ct + 2cg + 2tg = 1 \tag{1.14}$$

$$a^2 + c^2 \geq 2ac \quad c^2 + t^2 \geq 2ct \tag{1.15}$$
$$a^2 + t^2 \geq 2at \quad c^2 + g^2 \geq 2cg \tag{1.16}$$
$$a^2 + g^2 \geq 2ag \quad t^2 + g^2 \geq 2tg \tag{1.17}$$

substitude $2ac, 2ag, \ldots$ in equation 1.14, we can get

$$4(a^2 + c^2 + t^2 + g^2) \geq a^2 + c^2 + t^2 + g^2 + 2ac + 2at + 2ag + 2ct + 2cg + 2tg$$

Then we get the inequality 1.13.

1.2 1.4 逻辑符号与对偶法则

The law of duality: $\forall(\exists) \to \exists(\forall)$ with negative statement

Inverse proposition?

1. A have upper limit, $\exists M > 0.\forall x \in A, x \leqslant M$.

It's negative statement is 'A don't have upper limit'. $\forall M > 0, \exists x \in A, x > M$.

2. the minum item in A is b, $b \in A, \forall x \in A, x \geq b$.

It's negative statement is 'b is not the minum item in A'. $b \in A, \exists x \in A, x < b$.

3. $f \in (a,b)$ is a monotonic augmentation function, $\forall x, y \in (a,b), x < y, f(x) \leqslant f(y)$.(or $f(x) < f(y)$, depends on monotonic function's definition)

It's negative statement is '$f \in (a,b)$ isn't a monotonic augmentation function'. $\exists x, y \in (a,b), x < y, f(x) > f(y)$ (or $f(x) \geq f(y)$).

4. $f \in (a,b)$ is a monotonic function, $\forall x, y, z \in (a,b), x < y < z, (f(x) - f(y))(f(y) - f(z)) \geq 0$.

It's negative statement is '$f \in (a,b)$ isn't a monotonic function'. $\exists x, y, z \in (a,b), x < y < z, (f(x) - f(y))(f(y) - f(z)) < 0$.

(Another way $\forall x, y \in (a,b), x < y, f(x) - f(y) \geq 0$ or $f(x) - f(y) \leqslant 0$.)

5. $A \subset B, \forall x \in A, x \in B$.

It's negative statement is $A \subsetneq B$, $\exists x \in A, x \notin B$.

6. $A - B \neq \emptyset, \exists x \in A, x \in B$.

It's negative statement is $A - B = \emptyset$, $\forall x \in A, x \notin B$.

7. x_n is an infinitesimal amounts, $\forall \epsilon > 0, \exists N \in \mathbb{N}^+, \forall n > N, |x_n| < \epsilon$.

It's negative statement is 'x_n is not an infinitesimal amounts', $\exists \epsilon > 0, \forall N \in \mathbb{N}^+, \exists n > N, |x_n| \geq \epsilon$.

8. x_n is infinitely large, $\forall M > 0, \exists N \in \mathbb{N}^+, \forall n > N, x_n > M$.

It's negative statement is 'x_n is not infinitely large', $\exists M > 0, \forall N \in \mathbb{N}^+, \exists n > N, x_n \leqslant M$.

Chapter 2 第二章数列极限

2.1 数列极限的基本概念

2.1.1 2.1.5 练习题

1. prove by Limit definition:

(1). $\lim_{n \to \infty} \frac{3n^2}{n^2 - 4} = 3$.

(2). $\lim_{n \to \infty} \frac{\sin n}{n} = 0$.

(3). $\lim_{n \to \infty} (1 + n)^{\frac{1}{n}} = 0$.

(4). $\lim_{n \to \infty} \frac{a^n}{n!} = 0, (a > 0)$.

2. Suppose $a_n, n \in \mathbb{N}_+$. sequence a_n converge to a.
Prove $\lim_{n \to \infty} \sqrt{a_n} = \sqrt{a}$.

Proof $n \to \infty a_n \to a$.

$\forall \epsilon > 0, \exists N(\epsilon) \in \mathbb{N}^+, \forall n > N(\epsilon), |a_n - a| < \epsilon$.

$$|\sqrt{a_n} - \sqrt{a}| = \left| \frac{a_n - a}{\sqrt{a_n} + \sqrt{a}} \right| < \frac{\epsilon}{\sqrt{a_n} + \sqrt{a}}$$

$\therefore \lim_{n \to \infty} \sqrt{a_n} = \sqrt{a}$. $\square$ (check, not consider the condition $a = 0$) add $a = 0, \forall \epsilon \in (0, 1), \exists N(\epsilon) \in \mathbb{N}^+, \forall n > N(\epsilon), |a_n - a| < \epsilon$. s.t $a_n < \epsilon^2 < \epsilon$, $\sqrt{a_n} < \epsilon$.

3. If $\lim_{n \to \infty} a_n = a$.
Prove $\lim_{n \to \infty} |a_n| = |a|$. Vice versa?

Proof $\forall \epsilon > 0, \exists N(\epsilon) \in \mathbb{N}^+, \forall n > N(\epsilon), |a_n - a| < \epsilon$.

$$\Big| |a_n| - |a| \Big| \leqslant |a_n - a| < \epsilon$$

$\therefore \lim_{n \to \infty} |a_n| = |a|$

If We know $\lim_{n \to \infty} |a_n| = |a|$.

$\forall \epsilon > 0, \exists N(\epsilon) \in \mathbb{N}^+, \forall n > N(\epsilon), \big| |a_n| - |a| \big| < \epsilon$. We can't get $\lim_{n \to \infty} a_n = a$. For example: $a_n = \frac{1}{n} + 1, a = -1$, $\lim_{n \to \infty} |a_n| = |a|$ is $\lim_{n \to \infty} |\frac{1}{n} + 1| = |-1|$, but $\lim_{n \to \infty} \frac{1}{n} + 1 \neq -1$ $\square$

(1). Suppose $p(x)$ is a polynomial of x, if $\lim_{n \to \infty} a_n = a$, Prove $\lim_{n \to \infty} p(a_n) = p(a)$.

(2). Suppose $b > 0$, $\lim_{n \to \infty} a_n = a$. Prove $b^{a_n} = b^a$.

(3). Suppose $b > 0$, $\{a_n\}, a_n > 0, \forall n \in \mathbb{N}$. $\lim_{n \to \infty} a_n = a. a > 0$. Prove $\lim_{n \to \infty} \log_b a_n = \log_b a$.

(4) Suppose $b \in \mathbb{R}$, $\{a_n\}, a_n > 0$ when $n \in \mathbb{N}$. $\lim_{n \to \infty} a_n = a$. Prove $\lim_{n \to \infty} a_n{}^b = a^b$.

(5) Suppose $\lim_{n \to \infty} a_n = a$. Prove $\lim_{n \to \infty} \sin a_n = \sin a$.

Proof 4.(1)

$\forall \epsilon > 0, \exists N(\epsilon) \in \mathbb{N}^+, \forall n \geqslant N(\epsilon), |a_n - a| < \epsilon$.

$p(a) = k_m a^m + k_{m-1} a^{m-1} + \cdots + k_0 a^0$.

$\therefore p(a_n) - p(a) = k_m(a_n^m - a^m) + k_{m-1}(a_n^{m-1} - a^{m-1}) + \cdots + k_0(a_n^0 - a^0)$.

$$|a_n^m - a^m| = |a_n - a| \cdot |a_n^{m-1} + a_n^{m-2}a + \cdots + a^{m-1}|$$
$$< \epsilon \cdot |a_n^{m-1} + a_n^{m-2}a + \cdots + a^{m-1}|$$
$$< \epsilon(m-1) \cdots (a + \delta)^{m-1}$$

$\therefore \lim_{n\to\infty} p(a_n) = p(a).$ $\quad\square$

Proof 4.(2)

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+.\forall n \geqslant N, |a_n - a| < \epsilon.$

If $b = 1$, $1^{a_n} = 1^a = 1$.

If $b > 1$, $b^{a_n} - b^a = b^a(b^{a_n - a} - 1) < b^a(b^\epsilon - 1)$ $0 < |b^{a_n} - b^a| < b^a \cdot (b^\epsilon - 1)$ $\because b > 0, \epsilon \to 0, \therefore b^\epsilon - 1 \to 0.$

$\therefore \lim_{n\to\infty} b_n^a = b^a.$

If $b < 1$, $b^{a_n} = \frac{1}{(\frac{1}{b})^{a_n}}$, we can prove this condition by considering $\frac{1}{b} > 1$.

Proof 4.(3)

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+.\forall n \geqslant N, |a_n - a| < \epsilon.$

$$\log_b a_n - \log_b a = \log_b \frac{a_n}{a}$$
$$= \log_b(\frac{a_n - a}{a} + 1) < \log_b(\frac{\epsilon}{a} + 1)$$

$0 < \log_b a_n - \log_b a| < \log_b(1 + \frac{\epsilon}{a})$. $\because b > 0, a \neq 0, a_n > 0$ when $\epsilon \to 0$. $\therefore \log_b(1 + \frac{\epsilon}{a}) \to 0.$

$\therefore \lim_{n\to\infty} \log_b a_n = \log_b a$

Proof 4.(4)

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+.\forall n \geqslant N, |a_n - a| < \epsilon.$

$a_n^b = e^{b\ln a_n}$, $a_n^b - a^b = e^{b\ln a_n} - e^{b\ln a}$.

$$e^{b\ln a_n} - e^{b\ln a} = e^{b\ln a}(e^{b\ln a_n - b\ln a} - 1)$$
$$= e^{b\ln a}(e^{b\ln \frac{a_n}{a}} - 1)$$

$0 < |a_n^b - a^b| < e^{b\ln a}(e^{b\ln(1+\frac{\epsilon}{a})} - 1)$

$\therefore \lim_{n\to\infty} a_n^b = a^b$

Proof 4.(5)

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+.\forall n \geqslant N, |a_n - a| < \epsilon.$

$$\sin(A + B) - \sin(A - B) = \sin A \cos B + \cos A \sin B$$
$$- (\sin A \cos B - \cos A \sin B)$$
$$= 2\cos A \sin B$$
$$\sin a_n - \sin a = 2\cos \frac{a_n + a}{2} \sin \frac{a_n - a}{2}$$

$|\sin a_n - \sin a| = |2\cos \frac{a_n+a}{2} \sin \frac{a_n-a}{2}| < |2\sin \frac{a_n-a}{2}|$

$|2\sin \frac{a_n-a}{2}| < |2\frac{a_n-a}{2}| = \epsilon$

$|\sin a_n - \sin a| < \epsilon, \therefore \lim_{n\to\infty} \sin a_n = \sin a$

assume $a > 1$. Prove $\lim_{n\to\infty} \frac{\log_a n}{n} = 0$

Proof $\frac{1}{n}\log_a n = \log_a \sqrt[n]{n}$. We already know that $\lim_{n\to\infty} \sqrt[n]{n} = 1$, $\log_a 1 = 0$.

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+, N = \max\{2, [\frac{4}{\epsilon^2}]\}.\forall n \geqslant N, |\sqrt[n]{n} - 1| < \epsilon.$

$a > 1$, and $\lim_{n\to\infty} \sqrt[n]{n} = 1$. $\therefore$ when $n \to \infty$, $\sqrt[n]{n} < a^\epsilon$, take logarithm on base of a, we can get $\frac{1}{n}\log_a n < \epsilon$

$\therefore \lim_{n\to\infty} \frac{\log_a n}{n} = 0$

2.2 收敛数列的基本性质

收敛数列的性质

1. 收敛数列的极限是唯一的

2. 收敛数列一定有界

3. 收敛数列的比较定理，包括保号性定理

4. 收敛数列满足一定的四则运算规则

5. 收敛数列的每一个子列一定收敛于同一极限

2.2.1 思考题

1. $\{a_n\}$ 收敛, $\{b_n\}$ 发散, $\{a_n + b_n\}$ 发散, $\{a_n \cdot b_n\}$ 可能收敛，可能发散.

2. $\{a_n\}, \{b_n\}$ 都发散, $\{a_n + b_n\}$ 可能收敛，可能发散 (ex: $n + -n$, $n + -2n$), $\{a_n \cdot b_n\}$ 发散 (?).

3. $a_n \leqslant b_n \leqslant c_n$, $n \in \mathbb{N}_+$. 已知 $\lim\limits_{n\to\infty}(c_n - a_n) = 0$. 问数列 $\{b_n\}$ 是否收敛?

4. $\lim\limits_{n\to\infty}\left(\frac{1}{n+1} + \cdots + \frac{1}{2n}\right)$

5. $a_n \to a(n \to 0)$. $\forall n, b < a_n < c$. 是否成立 $b < a < c$?

6. $a_n \to a(n \to 0)$. and $b \leqslant a \leqslant c$, 是否存在 $N \in \mathbb{N}_+$, s.t. 当 $n > N$ 时，成立 $b \leqslant a_n \leqslant c$

7. 已知 $\lim\limits_{n\to\infty} a_n = 0$, 问: 是否有 $\lim\limits_{n\to\infty}(a_1 a_2 \ldots a_n) = 0$. 反之如何?

Proof 5.4

$$\frac{n}{2n} \leqslant \frac{1}{n+1} + \cdots + \frac{1}{2n} \leqslant \frac{n}{n+1}$$

$\because \lim\limits_{n\to\infty} \frac{n}{2n} = \frac{1}{2}$ $\lim\limits_{n\to\infty}\frac{n}{n+1} = 1$, $\therefore \lim\limits_{n\to\infty}\left(\frac{1}{n+1} + \cdots + \frac{1}{2n}\right)$ 收敛.

$$\frac{1}{n+1} + \cdots + \frac{1}{2n} = \frac{1}{n}\left(\frac{1}{1 + \frac{1}{n}} + \frac{1}{1 + \frac{2}{n}} + \cdots + \frac{1}{1 + \frac{n}{n}}\right)$$
$$= \int_0^1 \frac{1}{1+x}\mathrm{d}x$$
$$= \ln(1+x)|_0^1 = \ln 2$$

$\lim\limits_{n\to\infty}\left(\frac{1}{n+1} + \cdots + \frac{1}{2n}\right) = \ln 2$

Proof 5.5

不成立，应当为小于等于号。b=0, c=2, $a_n = \frac{1}{n}$, $\lim_{n\to\infty} a_n = 0 = c$.

Proof 5.6

不成立。$a = 0, b = 0, c = 2, a_n = (-1)^n \frac{1}{n}$.

$b \leqslant a \leqslant c$, but $(-1)^{2n+1}\frac{1}{2n+1} < 0 = b$.

Proof $\lim\limits_{n\to\infty} a_n = 0, a_n = \frac{1}{n}. a_1 a_2 \ldots a_n = \frac{1}{n!}, \lim\limits_{n\to\infty}\frac{1}{n!} = 0$.

$\lim\limits_{n\to\infty} a_n = 0 \to \lim\limits_{n\to\infty}(a_1 a_2 \ldots a_n) = 0$ ✓

$\lim\limits_{n\to\infty}(a_1 a_2 \ldots a_n) = 0 \to \lim\limits_{n\to\infty} a_n = 0$ ✗

$|a_n| < \epsilon$, $|a_{N+1} \ldots a_n| < \epsilon^{n-N} < \epsilon$, $a_n < \sqrt[n]{\epsilon}$.

for example, $a_n = \frac{n}{n+1}, a_1 = \frac{1}{2}, a_2 = \frac{2}{3}, \ldots, a_n = \frac{n}{n+1}$.

$$a_1 a_2 \ldots a_n = \frac{1}{2} \cdot \frac{2}{3} \cdots \frac{n}{n+1} = \frac{1}{n+1}.$$
$$\lim\limits_{n\to\infty}(a_1 a_2 \ldots a_n)$$
$$= \lim\limits_{n\to\infty}\frac{1}{n} = 0$$

but $\lim\limits_{n\to\infty} a_n = \lim\limits_{n\to\infty}\frac{n}{n+1} = 1 \neq 0$

研究数列收敛方面的两个基本工具:

1. 夹逼定理.

2. 单调有界数列的收敛定理.

Example 2.1 2.2.2 $\lim_{n\to\infty}\frac{x_n - 1}{x_n + a} = 0$,

prove $\lim_{n\to\infty} x_n = a$

Proof　$\forall \epsilon > 0, \exists N \in \mathbb{N}^+.\forall n \geqslant N, |\frac{x_n-1}{x_n+a} - 0| < \epsilon.$

$|x_n - 1| < \epsilon|x_n + a| < 4a \cdot \epsilon.$(这个 4 是怎么取得的?)

$|x_n - a| < \epsilon|x_n + a| = \epsilon|(x_n - a) + 2a| \leqslant \epsilon(|x_n - a| + 2a).$

限制 $\epsilon < 1, |x_n - a| < 2\epsilon|a|/(1 - \epsilon).$

限制 $\epsilon < \frac{1}{2}, |x_n - a| < 2\epsilon|a|/(1 - \epsilon) < 4|a|\epsilon.$

Let $\epsilon' = 4a\epsilon, |x_n - 1| < \epsilon'. \therefore \lim\lim_{n\to\infty} x_n = a.$

Example 2.2 2.2.3 $a > 0, b > 0$, 计算 $\lim_{n\to\infty} (a_n + b_n)^{\frac{1}{n}}.$

Proof　Suppose $a \leqslant b.$

$b = (b^b)^{\frac{1}{n}} < (a^n + b^n)^{\frac{1}{n}} \leqslant (2b^n)^{\frac{1}{n}}.$

$b < (a^n + b^n)^{\frac{1}{n}} \leqslant \sqrt[n]{2}b, \lim_{n\to\infty} = 1.$ 夹逼定理.

$\lim_{n\to\infty} (a^n + b^n)^{\frac{1}{n}} = \max\{a, b\}.$

两数 n 次方之和再开 n 次根号的结果由较大的值决定, a,b 中较大的值为这个数的主要部分.

Example 2.3 2.2.4 $a_n = \frac{1!+2!+\cdots+n!}{n!}, n \in \mathbb{N}^+$

$\lim_{n\to\infty} a_n = 1$

Example 2.4 $\lim_{n\to\infty} \frac{n^3+n-7}{n+3} = +\infty$

Example 2.5 $H_n = 1 + \frac{1}{2} + \cdots + \frac{1}{n}$

调和级数 H_n 发散.

2.2.2 练习 2.2.4

Proof　1.

$\{a_n\}$ 收敛于 a, $\to$ 两个子列 $\{a_{2n}\}, \{a_{2n+1}\}$ 均收敛于 a.

两个子列 $\{a_{2n}\}, \{a_{2n+1}\}$ 均收敛于 a, $\to \{a_n\}$ 收敛于 a.

2. 应用夹逼定理

(1). 给定 p 个正数 $a_1, a_2, \ldots, a_p$. 求 $\lim_{n\to\infty} \sqrt[n]{a_1^n + a_2^n + \ldots a_p^n}.$

Let $a_s = \max_{1\leqslant i\leqslant p}\{a_1, a_2, \ldots, a_p\}.$

$$a_s = (a_s^n)^{\frac{1}{n}} < (a_1^n + a_2^n + \ldots a_p^n)^{\frac{1}{n}} \leqslant (pa_s^n)^{\frac{1}{n}} = p^{\frac{1}{n}} a_s$$

$n \to \infty, p^{\frac{1}{n}} \to 1. \lim_{n\to\infty} (a_1^n + a_2^n + \ldots a_p^n)^{\frac{1}{n}} = a_s$

(2). $x_n = \frac{1}{\sqrt{n^2+1}} + \frac{1}{\sqrt{n^2+2}} + \cdots + \frac{1}{\sqrt{n^2+n}}, n \in \mathbb{N}_+.$ 求 $\lim_{n\to\infty} x_n$

$$\frac{2n+1}{(n+1)} \leqslant x_n \leqslant \frac{2n+1}{\sqrt{n^2+1}}$$

$\lim_{n\to\infty} \frac{2n+1}{n+1} = 2, \lim_{n\to\infty} \frac{2n+1}{\sqrt{n^2+1}} = 2. \therefore \lim_{n\to\infty} x_n = 2$

(3). $a_n = (1 + \frac{1}{2} + \cdots + \frac{1}{n})^{\frac{1}{n}}, n \in \mathbb{N}_+.$ 求 $\lim_{n\to\infty} a_n$

$$1 = (\frac{n}{n})^{\frac{1}{n}} < a_n \leqslant (1 \cdot n)^{\frac{1}{n}} = \sqrt[n]{n}$$

$\lim_{n\to\infty} \sqrt[n]{n} = 1, \therefore \lim_{n\to\infty} a_n = 1$

(4). $a_n > 0$. $\lim\limits_{n\to\infty} a_n = a$, $a > 0$. 证明 $\lim\limits_{n\to\infty} \sqrt[n]{a_n} = 1$

Proof

$\lim\limits_{n\to\infty} a_n = a$

$\forall \epsilon > 0, \exists N \in \mathbb{N}^+ . \forall n \geqslant N, |a_n - a| < \epsilon.$

$$0 < a - \epsilon < a_n < a + \epsilon$$

$\therefore \sqrt[n]{a - \epsilon} < \sqrt[n]{a_n} < \sqrt[n]{a + \epsilon}.$

$\lim\limits_{n\to\infty} \sqrt[n]{a - \epsilon} = 1$, $\lim\limits_{n\to\infty} \sqrt[n]{a + \epsilon} = 1$. $\therefore \lim\limits_{n\to\infty} \sqrt[n]{a_n} = 1.$

$\lim\limits_{n\to\infty} (1+x)(1+x^2)\dots(1+x^{2^n}) = \lim\limits_{n\to\infty} \prod_{i=1}^{2^n}(1+x^i)$, $|x| < 1$.

$|x| < 1, \quad 1 > x^2 > x^4 > \dots > x^{2^n} > 0$

$x \in (0,1) \quad 1 < (1+x)(1+x^2)\dots(1+x^{2^n}) < (1+x)^{n+1}$ $\qquad\qquad \lim\limits_{n\to\infty}(1+x)^{n+1} = 1$

$x \in (-1,0) \quad 0 < (1+x)(1+x^2)\dots(1+x^{2^n}) < (1+x)(1+x^2)^n$ $\qquad \lim\limits_{n\to\infty}(1+x)(1+x^2)^n = 1$

$$\lim_{n\to\infty}(1+x)(1+x^2)\dots(1+x^n)$$
$$= \lim_{n\to\infty} \frac{(1-x)(1+x)(1+x^2)\dots(1+x^n)}{1-x}$$
$$= \lim_{n\to\infty} \frac{(1-x^{2^{n+1}})}{1-x}$$
$$= \frac{1}{1-x}$$

$$\lim_{n\to\infty}(1-\frac{1}{2^2})(1-\frac{1}{3^2})\dots(1-\frac{1}{n^2})$$
$$= \lim_{n\to\infty} \frac{1}{2}\cdot\frac{3}{2}\cdot\frac{2}{3}\cdot\frac{4}{3}\cdot\frac{3}{4}\cdot\frac{5}{4}\cdot\frac{4}{5}\cdot\frac{6}{5}\cdots\frac{n-1}{n}\cdot\frac{n+1}{n}$$
$$= \lim_{n\to\infty} \frac{1}{2}\frac{n+1}{n}$$
$$= \lim_{n\to\infty} \frac{1}{2}$$

$$\lim_{n\to\infty}\left(1-\frac{1}{1+2}\right)\left(1-\frac{1}{1+2+3}\right)\dots\left(1-\frac{1}{1+2+\dots+n}\right)$$
$$= \lim_{n\to\infty}\left(1-\frac{2}{3\times 2}\right)\left(1-\frac{2}{4\times 3}\right)\dots\left(1-\frac{2}{(n+1)\times n}\right)$$
$$= \lim_{n\to\infty}\left(\frac{3\times 2-2}{3\times 2}\right)\left(\frac{4\times 3-2}{4\times 3}\right)\dots\left(\frac{(n+1)\times n-2}{(n+1)\times n}\right)$$
$$= \lim_{n\to\infty}\left(\frac{4}{3\times 2}\right)\left(\frac{10}{4\times 3}\right)\dots\left(\frac{n^2+n-2}{(n+1)\times n}\right)$$
$$= \lim_{n\to\infty}\left(\frac{1\times 4}{3\times 2}\right)\left(\frac{2\times 5}{4\times 3}\right)\dots\left(\frac{(n-2)\times(n+1)}{n\times(n-1)}\right)\left(\frac{(n-1)\times(n+2)}{(n+1)\times n}\right)$$
$$= \lim_{n\to\infty}\frac{1}{3}\times\frac{n+2}{n}$$
$$= \frac{1}{3}$$

$$\lim_{n\to\infty}\left[\frac{1}{1\cdot 2}+\frac{1}{2\cdot 3}+\cdots+\frac{1}{n\cdot(n+1)}\right]$$
$$=\lim_{n\to\infty}\frac{1}{1}-\frac{1}{2}+\frac{1}{2}-\frac{1}{3}+\cdots+\frac{1}{n}-\frac{1}{n+1}$$
$$=\lim_{n\to\infty}\frac{1}{1}-\frac{1}{n+1}$$
$$=\lim_{n\to\infty}\frac{n}{n+1}$$
$$=1$$

3.(4).

$$\lim_{n\to\infty}\left[\frac{1}{1\cdot 2\cdot 3}+\frac{1}{2\cdot 3\cdot 4}+\cdots+\frac{1}{n\cdot(n+1)\cdot(n+2)}\right]$$
$$=\lim_{n\to\infty}\frac{1}{2}\left(\frac{1}{1\cdot 2}-\frac{1}{2\cdot 3}\right)+\frac{1}{2}\left(\frac{1}{2\cdot 3}-\frac{1}{3\cdot 4}\right)+\cdots+\frac{1}{2}\left(\frac{1}{n(n+1)}-\frac{1}{(n+1)(n+2)}\right)$$
$$=\lim_{n\to\infty}\frac{1}{2}\left(\frac{1}{1\cdot 2}-\frac{1}{(n+1)(n+2)}\right)$$
$$=\frac{1}{2}\times\frac{1}{2}$$
$$=\frac{1}{4}$$

3.(5).

$$\lim_{n\to\infty}\sum_{k=1}^{n}\frac{1}{k(k+1)\ldots(k+\gamma)},\qquad 其中\gamma为正整数$$
$$=\lim_{n\to\infty}\sum_{k=1}^{n}\frac{1}{\gamma}\left[\frac{1}{k(k+1)\ldots(k+\gamma-1)}-\frac{1}{(k+1)(k+2)\ldots(k+\gamma)}\right]$$
$$=\lim_{n\to\infty}\frac{1}{\gamma}\left[\sum_{k=1}^{n}\frac{1}{k(k+1)\ldots(k+\gamma-1)}-\sum_{k=1}^{n}\frac{1}{(k+1)(k+2)\ldots(k+\gamma)}\right]$$
$$=\lim_{n\to\infty}\frac{1}{\gamma}\left[\frac{1}{\gamma^{\underline{\gamma}}}-\frac{1}{(n+\gamma)^{\underline{\gamma}}}\right]$$
$$=\lim_{n\to\infty}\frac{1}{\gamma}\left[\frac{1}{\gamma!}-\frac{1}{(n+\gamma)^{\underline{\gamma}}}\right]$$
$$=\frac{1}{\gamma}\cdot\frac{1}{\gamma!}$$

其中 $x^{\underline{n}}=x(x-1)(x-2)\ldots(x-n+1)$, 称为下阶乘. 而 $x^{\overline{n}}=x(x+1)(x+2)\ldots(x+n-1)$, 称为上阶乘.

2.2.4-4 $S_n=a+3a^2+\cdots+(2n-1)a^n$, $|a|<1$. 求 $\{S_n\}$ 的极限.

$$S_n-aS_n=a+3a^2+\cdots+(2n-1)a^n$$
$$-\ a^2-\cdots+(2n-3)a^n-(2n-1)a^n+1$$
$$=a+2a^2+\cdots+2aa^n-(2n-1)a^{n+1}$$
$$=2(a+a^2+\cdots+a^n)-a-(2n-1)a^{n+1}$$
$$=2\cdot a\frac{1-a^{n+1}}{1-a}-a-(2n-1)a^{n+1}$$

$|a|<1$, $\lim_{n\to\infty}a_n=0$

$$\lim_{n\to\infty} (S_n - aS_n) = (1-a)\lim\lim_{n\to\infty} S_n$$

$$\begin{aligned}
\lim_{n\to\infty} (S_n - aS_n) &= \lim_{n\to\infty} 2a \cdot \frac{1-a^{n+1}}{1-a} - a - (2n-1)a^{n+1} \\
&= 2a \cdot \frac{1}{1-a} - a \\
&= a\left(\frac{2}{1-a} - a\right) \\
&= a\frac{1+a}{1-a}
\end{aligned}$$

$\therefore \lim\limits_{n\to\infty} S_n = \frac{a(a+1)}{(1-a)^2}$

2.2.4-5 设 $\lim\limits_{n\to\infty} x_n = A > 0$. 取 $\epsilon = \frac{A}{2}$, 则 $\exists N \in \mathbb{N}_+$. $\forall n > N$. 成立 $|x_n - A| < \frac{A}{2}$

$$A - \frac{A}{2} < x_n < A + \frac{A}{2}, \frac{A}{2} < x_n < \frac{3A}{2}$$

即 $x_n > \frac{A}{2}$.

令 $m = \min\{x_1, x_2, \ldots, x_N, \frac{A}{2}\} > 0$. 则 m 为 $\{x_n\}$ 的正下界.

不一定有最小数的例子 $x_n = 1 + \frac{1}{n}$. $\lim\limits_{n\to\infty} x_n = 1$, 下界 $m = \frac{1}{2}$. 但 $\{x_n\}$ 取不到下界.

Proof 2.2.4-6 $\because \lim\limits_{n\to\infty} a_n = +\infty$. $\forall M > 0, \exists N \in \mathbb{N}_+, \forall n > N, a_n > M$.

$m = \min\{a_1, a_2, \ldots, a_N, M\}$, 但 M 在数列 $\{a_n\}$ 中不一定取的到!

$M = a_1 + 1, \exists N_1 \in \mathbb{N}_+, \forall n > N_1, a_n > M > a_1$

则 $m = \min\{a_1, a_2, \ldots, a_{N_1}\}$ 为数列的最小数.

Proof 2.2.4-7 构造数列

不妨设无界数列 $\{a_n\}$ 无上界.

$\forall M \in \mathbb{R}, \exists N \in \mathbb{N}_+, \forall n_k > N, a_{n_k} > M$.

取 $M_1 = 1$, 则 $\exists n_1 \in \mathbb{N}_+$ s.t. $a_{n_1} > M_1$.

取 $M_2 = \max\{a_n, 2\}, \exists n_2 \in \mathbb{N}_+$ s.t. $a_{n_2} > M_2$.

以此类推，构造数列 $\{a_{n_k}\}$. s.t. $a_{n_k} > k$. 即 a_{n_k} 为无穷大量.

Proof 2.2.4-8 证明 $\{a_n\}, a_n = \tan n$ 发散.

构造 a_n 的发散子列即可. 已知 $\tan\frac{\pi}{2} = \infty$, π 是一个无理数, 因此存在数列 $\{b_n\}$, $\lim\limits_{n\to\infty} b_n = \frac{\pi}{2}$.

Proof 2.2.4-8 证明 $\{a_n\}, a_n = \tan n$ 发散. 参考别人的答案

由于 $\{\sin 2n\}$ 极限不存在, 又

$$\sin 2n = 2\sin n \cos n = \frac{2\sin n \cos n}{\sin^2 n + \cos^2 n}$$

$$= \frac{2\tan n}{\tan^n + 1}$$

若 $\{\tan n\}$ 极限存在 $\to \{\sin 2n\}$ 极限存在, 矛盾.

故 $\{\tan n\}$ 极限不存在.

2.2.4-9 $S_n = \frac{1}{1^p} + \frac{1}{2^p} + \cdots + \frac{1}{n^p}$, $n \in \mathbb{N}_+$. S_n 在 1. $p \leqslant 0$, 2. $0 < p < 1$ 情况下均发散

Proof 1. $p \leqslant 0$. $\lim\limits_{n\to\infty} n^{-p} = \infty$, S_n 发散.

2. $0 < p < 1$. $\frac{1}{n^p} > \frac{1}{n}$. $\because H_n = \sum_{k=1}^{n} \frac{1}{k}$(调和级数) 发散, $S_n > H_n, \therefore \{S_n\}$ 也发散.

ex2.3.5 $0 < b < a$ 令 $a_0 = a, b_0 = b$ 递推公式

$$a_n = \frac{a_{n-1} + b_{n-1}}{2}, b_n = \sqrt{a_{n-1} b_{n-1}}, \quad n \in \mathbb{N}_+ \tag{2.1}$$

定义数列a_n, b_n. 证明这两个数列收敛于同一个极限 $AG(a, b)$.

由 AG 不等式 $a > \frac{a+b}{2} > \sqrt{ab} > b > 0$, 利用单调有界数列收敛原则可以证明上述结论.

$$AG(a, b) = \frac{\pi}{2G} \tag{2.2}$$

如果令 $a_1 = \frac{a+b}{2}, b_1 = \sqrt{ab}$. 则

$$G = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\phi}{\sqrt{a^2 \cos^2 \phi + b^2 \sin^2 \phi}} = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\theta}{\sqrt{a_1^2 \cos^2 \theta + b_1^2 \sin^2 \theta}} \tag{2.3}$$

上面这个公式是怎么得到的:

参考菲赫金哥尔茨 - 微积分学教程. 第二卷 315 小节的高斯公式, 蓝登变换.

$$G = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\phi}{\sqrt{a^2 \cos^2 \phi + b^2 \sin^2 \phi}} \qquad (a > b > 0) \tag{2.4}$$

这里令

$$\sin \phi = \frac{2a \sin \theta}{(a+b) + (a-b) \sin^2 \theta} \tag{2.5}$$

$\theta \in [0, \frac{\pi}{2}] \rightarrow \phi \in [0, \frac{\pi}{2}]$, 取微分

$$\cos \phi \mathrm{d}\phi = 2a \frac{(a+b) - (a-b) \sin^2 \theta}{[(a+b) + (a-b) \sin^2 \theta]^2} \cos \theta \mathrm{d}\theta \tag{2.6}$$

但是

$$\cos \phi = \frac{\sqrt{(a+b)^2 - (a-b)^2 \sin^2 \theta}}{(a+b) + (a-b) \sin^2 \theta} \cos \theta. \tag{2.7}$$

(2.6) / (2.7), 两式相除, 得到

$$\mathrm{d}\phi = 2a \frac{(a+b) - (a-b) \sin^2 \theta}{(a+b) + (a-b) \sin^2 \theta} \frac{\mathrm{d}\theta}{\sqrt{(a+b)^2 - (a-b)^2 \sin^2 \theta}} \tag{2.8}$$

另一方面

$$\sqrt{a^2 \cos^2 \phi + b^2 \sin^2 \phi} = a \frac{(a+b) - (a-b) \sin^2 \theta}{(a+b) + (a-b) \sin^2 \theta} \tag{2.9}$$

因而

$$\frac{\mathrm{d}\phi}{\sqrt{a^2 \cos^2 \phi + b^2 \sin^2 \phi}} = \frac{\mathrm{d}\theta}{\sqrt{(\frac{a+b}{2})^2 \cos^2 \theta + ab \sin^2 \theta}}. \tag{2.10}$$

如果令 $a_1 = \frac{a+b}{2}, b_1 = \sqrt{ab}$, 则

$$G = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\phi}{\sqrt{a^2 \cos^2 \phi + b^2 \sin^2 \phi}} = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\theta}{\sqrt{a_1^2 \cos^2 \theta + b_1^2 \sin^2 \theta}} \tag{2.11}$$

反复应用该公式, 得到

$$G = \int_0^{\frac{\pi}{2}} \frac{\mathrm{d}\phi}{\sqrt{a_n^2 \cos^2 \phi + b_n^2 \sin^2 \phi}}, \qquad (n = 1, 2, 3, \dots) \tag{2.12}$$

$$\frac{\pi}{2a_n} < G < \frac{\pi}{2b_n} \tag{2.13}$$

积分 G 可以归结到第一类全椭圆积分 $K(k) = (1 + k_1)K(k_1) = \frac{\pi}{2}(1 + k_1)(1 + k_2) \dots (1 + k_n)$

$$\int_0^{\frac{pi}{2}} \frac{\mathrm{d}\phi}{\sqrt{1 - k^2 \sin^2 \phi}} = (1 + k_1) \int_0^{\frac{pi}{2}} \frac{\mathrm{d}\theta}{\sqrt{1 - k_1^2 \sin^2 \theta}} \tag{2.14}$$

其中
$a_1 = \frac{1 + \sqrt{1 - k^2}}{2} = \frac{1 + k'}{2}, b_1 = \sqrt{k'}$
$k_1 = \frac{\sqrt{a_1^2 - b_1^2}}{a_1} = \frac{1 - k'}{1 + k'}, \frac{1}{a_1} = 1 + k_1$

2.3 2.3 单调数列

Example 2.6 2.3.6

$$
\begin{aligned}
\frac{a_{n+1}}{a_n} &= \frac{\frac{1!+2!+\cdots+(n+1)!}{(n+1)!}}{\frac{1!+2!+\cdots+n!}{n!}} \\
&= \frac{1}{n+1}\frac{1!+2!+\cdots+(n+1)!}{1!+2!+\cdots+n!} \\
&= \frac{3+3!+\cdots+(n+1)!}{(n+1)1!+(n+1)2!+\cdots+(n+1)!}
\end{aligned}
$$

$n>2$ 时, 分母每一项大于等于分子对应项.. $n>2$ 后a_n 单调减少. 由于 0 是下界, 因此 a_n 单调有界, 数列收敛.

$$
\begin{aligned}
a_{n+1} &= \frac{1!+2!+\cdots+(n+1)!}{(n+1)!} \\
&= \frac{1!+2!+\cdots+n!}{n!}\frac{1}{n+1}+1 \\
&= 1+\frac{a_n}{n+1}
\end{aligned}
$$

设 $n\to\infty$ 时, $a_n\to a$

$$
a = 1+\left(\frac{1}{n+1}\to 0\right) = 1+0, \qquad \therefore a = 1
$$

$\therefore \lim\limits_{n\to\infty} a_n = \lim\limits_{n\to\infty}\frac{1!+2!+\cdots+n!}{n!} = 1$

2.3.1 2.3.2 练习题

证明, 若x_n 单调, 则$|x_n|$ 至少从某项开始后单调, 又问: 反之如何?

Proof   分类讨论, 不妨设 $x_1\geqslant 0$

1. x_n 单调递增, $|x_n|$ 从第一项开始单调.

2. x_n 单调递减, 且 $|x_n|\geqslant 0$. $|x_n|$ 从第一项开始单调.

3. x_n 单调递减, 且 $\exists N$ s.t. $x_n<0$(第一个负数项). 则$|x_n|$ 从第 N 项 (x_N) 开始单调.

反之该结论不成立.

反例: $x_n = \frac{(-1)^n}{n}$, $|x_n|$ 单调递减. 但 $x_{2k} = \frac{1}{2k}>0>x_{2k-1}=\frac{-1}{2k-1}$

设a_n 单调增加, b_n 单调减少, 且有 $\lim\limits_{n\to\infty}(a_n-b_n)=0$.

证明: 数列a_n 和b_n 都收敛, 且极限相等.

Proof $\lim\limits_{n\to\infty}(a_n-b_n)=0$, $\forall\epsilon>0, \exists N\in\mathbb{N}_+, \text{s.t.}\forall n>N, |a_n-b_n-0|<\epsilon$.

$b_n-\epsilon<a_n<b_n+\epsilon$, 同时有 $a_n-\epsilon<b_n<a_n+\epsilon$.

b_n 单调减少, $\therefore \exists N_2, \forall m<N_2, b_m>b_n+\epsilon$.

使用反证法证明 b_m 是a_n 的上界.

假设 b_m 不是a_n 的上界，则存在 $a_n>b_m>b_n+\epsilon$, 这与 $|a_n-b_n|<\epsilon$ 矛盾.

$\therefore b_m$ 是a_n 的上界, 根据单调有界收敛准则, a_n 收敛. 同理可证b_n 收敛. $\lim\limits_{n\to\infty}(a_n-b_n)=0$. $\therefore \lim\limits_{n\to\infty}a_n=\lim\limits_{n\to\infty}b_n$.

按照极限定义证明:

1. 单调增加有上界的数列的极限不小于数列中的任何一项.

2. 单调减少有下界的数列的极限不大于数列中的任何一项.

设 $x_n = \frac{2}{3}\cdot\frac{3}{5}\cdots\frac{n+1}{2n+1}$, $n\in\mathbb{N}_+$, 求数列x_n 的极限.

$$
\frac{x_{n+1}}{x_n} = \frac{(n+1)+1}{2(n+1)+1} = \frac{n+2}{2n+3}<1. \qquad (n>0) \tag{2.15}
$$

x_n 单调递减. $\because x_n>0, \therefore x_n$ 有下界, x_n 收敛.

$$\lim_{n \to \infty} \frac{x_{n+1}}{x_n} = \lim_{n \to \infty} \frac{n+2}{2n+3} = \frac{1}{2}$$

$\left(\frac{1}{2}\right)^n < x_n < \left(\frac{2}{3}\right)^n$, 由夹逼定理, $\lim_{n \to \infty} x_n = 0$

6. 在例题 2.2.6 的基础上证明: 当 $p > 1$ 时，数列 S_n 收敛. 其中

$$S_n = 1 + \frac{1}{2^p} + \frac{1}{3^p} + \frac{1}{4^p} + \cdots + + \frac{1}{n^p}, \quad n \in \mathbb{N}_+$$

(S_n 就是 p 级数, 当 $p = 1$ 时为调和级数.)

Proof S_n 单调递增, 记 $\frac{1}{2^{p-1}} = r$, 则 $0 < r < 1$.

$$\frac{1}{2^p} + \frac{1}{3^p} < \frac{1}{2^p} + \frac{1}{2^p} \qquad\qquad\qquad = \frac{1}{2^{p-1}} = r$$

$$\frac{1}{4^p} + \frac{1}{5^p} + \frac{1}{6^p} + \frac{1}{7^p} < \frac{1}{4^p} + \frac{1}{4^p} + \frac{1}{4^p} + \frac{1}{4^p} \qquad\qquad = \frac{1}{4^{p-1}} = r^2$$

$$\frac{1}{(2^k)^p} + \cdots + \frac{1}{(2^{k+1}-1)^p} < \frac{1}{(2^k)^p} + \frac{1}{(2^k)^p} + \cdots + \frac{1}{(2^k)^p} \qquad = \frac{1}{(2^k)^{p-1}} = r^k$$

由此可知

$$S_n \leqslant S_{2^n - 1} < 1 + r + r^2 + \cdots + r^{n-1} = \frac{1 - r^n}{1 - r} < \frac{1}{1 - r}$$

S_n 单调递增有上界，由单调有界收敛准则知 S_n 收敛。

7. 设 $0 < x_0 < \frac{\pi}{2}$, $x_n = \sin x_{n-1}$. $n \in \mathbb{N}_+$.
证明 x_n 收敛，并求其极限。

Proof $x_0 \in (0, \frac{\pi}{2})$, $\sin x$,
$0 < x_1 = \sin x_0 < x_0 < \frac{\pi}{2}$.
$0 < x_2 = \sin x_1 < x_1 < \frac{\pi}{2}$.
$0 < \cdots < x_n < x_{n-1} < \cdots < x_2 < x_1 < \frac{\pi}{2}$.
x_n 单调递减有下界，x_n 收敛。
$a = \sin a, \quad a \in [0, \frac{\pi}{2}]$
解得 $a = 0$，$\therefore \lim_{n \to \infty} x_n = 0$.
